Copilot Studio

G

Kom i gang med Copilot Studio

Hello!

Thank you for joining me today

Instructor: Morten Nordli

Microsoft Certified Trainer

AI consultant

AI Certified instructor, startup entrepreneur, ...

www.linkedin.com/in/datavettmorten

Introductions (Participants)

- What's your name?
- Which company/group do you represent?
- What is your role?
- Experience with Copilot Studio or other AI technologies
- What are your expectations from this training?

Mål med kurset:

- Dette tre-dagers kurset gir deltakerne en grundig og praktisk innføring i bruk av Microsoft Copilot Studio for å bygge intelligente agenter.
- Deltakerne vil lære å utvikle både deklarative agenter og stand-alone-agenter, og få innsikt i hvordan man kan utvide Microsoft 365 Copilot med egne handlinger og koblinger via Copilot Studio.
- Kurset er rettet mot nybegynnere og krever ingen tidligere erfaring med Power Platform eller Copilot Studio.

Forkunnskaper

- Grunnleggende digital kompetanse
- Interesse for teknologi og AI
- Ingen krav til erfaring med Power Platform eller Copilot Studio

Etter endt kurs skal deltakerne kunne:

- Forstå grunnprinsippene bak generativ AI og hvordan det brukes i Copilot Studio
- Navigere i Copilot Studio og forstå dets komponenter
- Lage deklarative agenter ved hjelp av ferdige verktøy og maler
- Utvikle stand-alone agenter med generative svar og tilpasset logikk
- Skrive effektive prompts (instruksjoner) for å styre agentenes atferd
- Integrere agenter med datakilder og bruke Power Platform-funksjonalitet
- Teste, publisere og overvåke agenter i praksis

Dag 1: Introduksjon og grunnleggende ferdigheter

- Hva er generativ AI? – Introduksjon og anvendelser
- Hva er en agent? Deklarative vs. stand-alone agenter
- Oversikt over Microsoft Copilot Studio
- Lage gode og effektive instruksjoner
- Lage en deklarativ agent: Bygg en enkel OfteStilteSpørsmål-agent
- Tilpasning av dialoger og emner

Dag 2: Generative svar og integrasjoner

- Hvordan utvide Microsoft 365 Copilot med egne handlinger og koblinger
- Bruk av generative svar og AI-funksjoner
- Lage stand-alone agenter med tilpasset logikk
- Praktiske oppgaver: Bygg en agent med generative svar og datatilgang
- Workshop: Med utgangspunkt i konkrete scenarier bygger vi ferdige løsninger

Dag 3: Testing, publisering og beste praksis

- Testing og feilsøking av agenter
- Publisering og overvåking
- Sikkerhet og ansvarlig bruk av AI
- Avsluttende workshop: Lag en komplett agent fra idé til publisering
- Oppsummering og veien videre

Introduction to Copilot Studio

What is a copilot?

An experience using generative AI to assist humans with complex cognitive tasks.

- Chat using natural language (and code)
- You determine, guide, and approve the output
- Its value increases with complexity

Microsoft Power Platform

The low-code platform that spans Office 365, Azure, Dynamics 365, and standalone applications

Power Apps
Application development

Power Automate
Process automation

Power BI
Business analytics

Copilot Studio
Intelligent copilots

Power Pages
External websites

Data connectors

AI Builder

Microsoft Dataverse

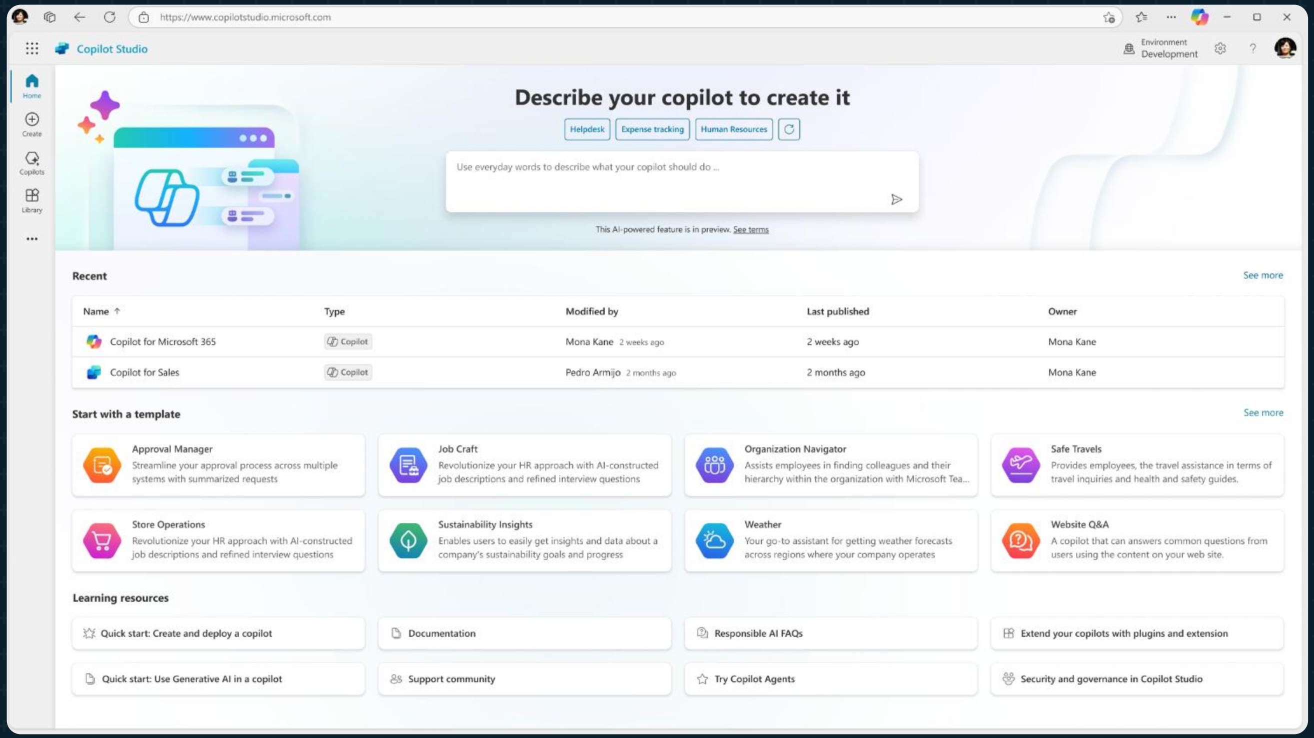
Power Fx

Managed Environments

Microsoft Copilot Studio

Your copilot, your way

Copilot Studio is an end-to-end conversational AI product for **building your own copilots** or **extending Microsoft Copilot** with generative AI, large language models and **your data**.



Demoer - introduksjon

Different building journeys for different needs

Copilot Studio

Included in Copilot for M365

Customize Microsoft Copilot

Connect with your data sources outside of Copilots reach

Call your redesigned business processes and workflows

Configure Copilot responses to specific questions

Building Copilot Extensions

Standalone

Azure AI Studio

Build your own custom copilots

Build customer or internal facing copilots with your data and workflows, on channels that work for you

Standalone	Azure AI Studio
Rules-based dialog management and conversational orchestration with a prebuilt LLM	Configure LLMs with prompt engineering
Managed SaaS, no infrastructure, built in security and governance	Manage own infrastructure, custom dev and security
Build Conversational Orchestration	**Build Models**

Extend Copilot Studio with Azure AI Studio

Agents

Every business process will have an agent

AI-powered system with actions, triggers and knowledge

Works on behalf of employees, teams and functions

Connected to Copilot or autonomous

Agents You Build
Tailored to your unique business processes.

Agents Built by Microsoft
Employee Self-Serve, SharePoint Agents, Dynamics 365 agents +

Agents Built by 3rd Party ISVs
Adobe, ServiceNow, SAP, and many more.

What is an agent?

- Intelligent assistant
- Enhanced capabilities of Microsoft 365 Copilot
- Optimized for a specific scenario/context
- Can seamlessly integrate with the tools and workflows you already use

What are Declarative agents?

HR agent

IT agent

PM agent

Legal agent

Tutor agent

Microsoft Managed AI Stack

Declarative agents = Microsoft 365 Copilot + your Instructions

What is additional Context on top of Microsoft 365 Copilot?

(*declarative*) Custom Instructions

Custom Prompt Instructions
(Natural Language)

Additional Grounding / Focus Data

Plugin

Connector

Data Sources (On-demand Retrieval)

Building Declarative agents

Teams Toolkit for
Visual Studio Code

OR

Copilot Studio

Oppgave 1

Copilots and Conversational AI

Build and extend across the Microsoft ecosystem

Custom copilots

Build Custom copilots and bots for enterprises and third parties

Microsoft 365

Extend Microsoft 365 Copilot

Biz Apps & Power Platform

Extend Copilot experiences in Dynamics 365 and Power Products

Copilot for Sales

Copilot for Service

Power Platform

Other Microsoft Copilots

Extend other Microsoft Copilot Experiences

Microsoft Copilot Studio

Build custom Copilots | **Extend and customize** 1st party copilots

Bot Framework / SDK

Bot Service Channels

Azure AI Studio

Azure Cognitive Services

Power Platform Connectors

AI Builder

Build & Publish
Copilot Studio
Analyze & Improve

How to build a custom copilot

1 Start

Create a copilot

Stand up Copilot Studio's SaaS in minutes

2 Build

Design the conversation

Connect your knowledge base for generative answers, create rule-based topics, integrate plugins and data connectors, and extend with Azure AI Studio.

3 Publish

Publish to different channels

Publish your copilot to Teams, websites, apps, social media channels and more.

4 Manage

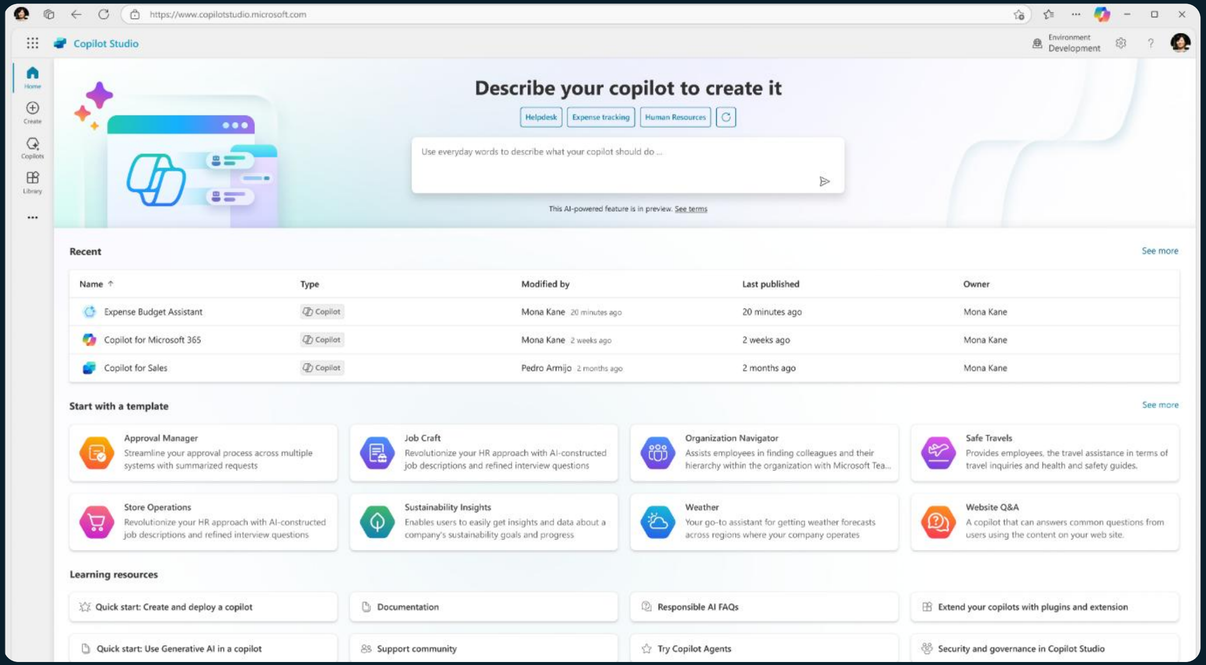
Control and improve

Monitor, manage and improve the copilot with enterprise-grade security and controls.

Build & Publish

Create a copilot

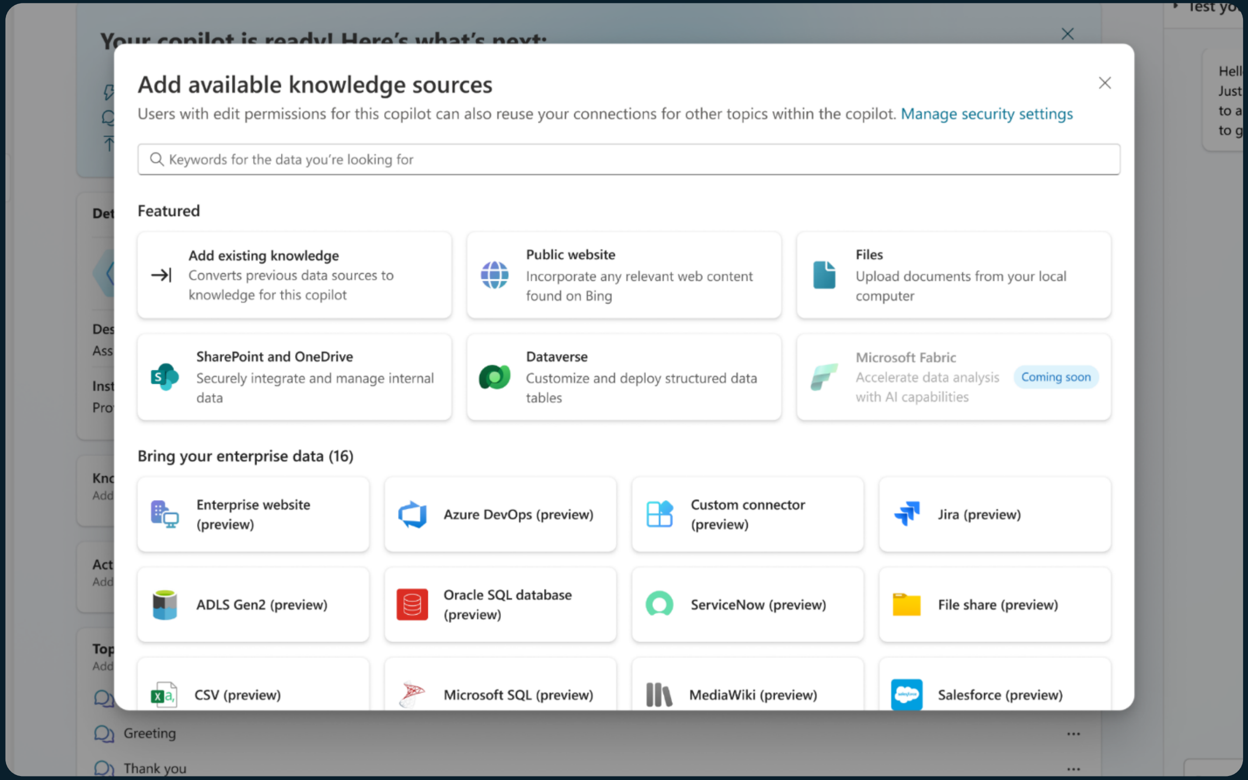
Build a copilot and go live within minutes, all from one easy-to-use, E2E SaaS product



Build & Publish

Add knowledge

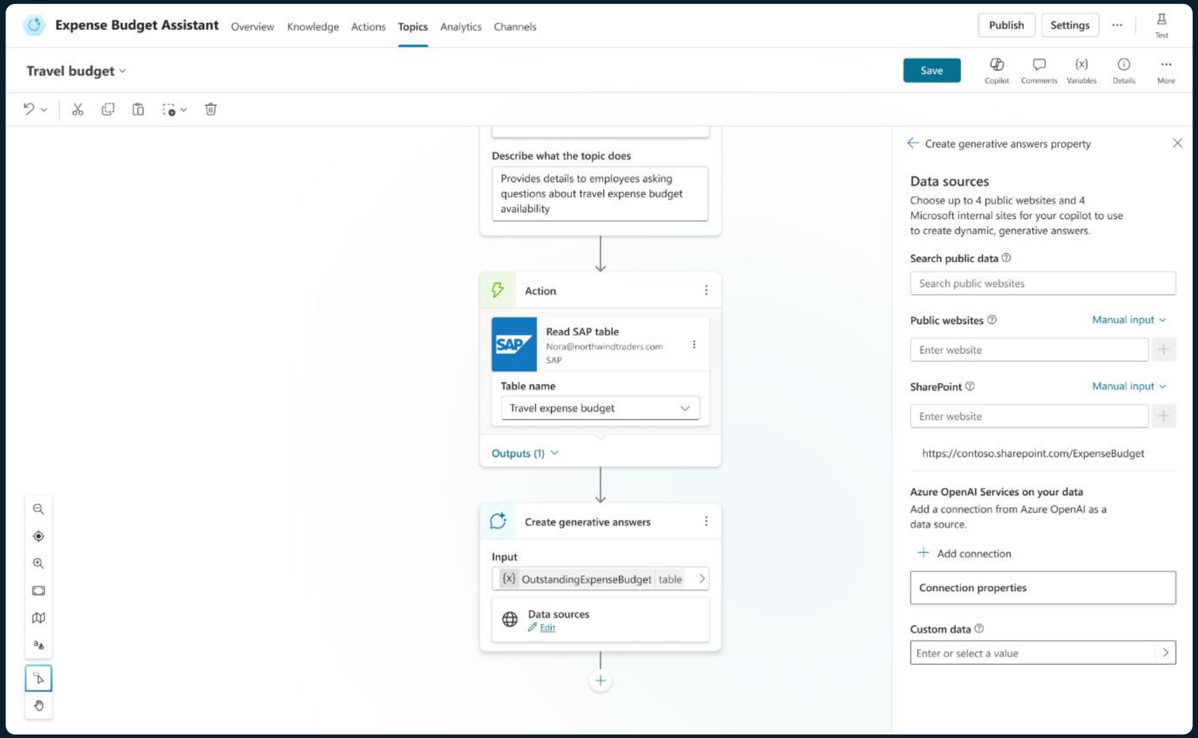
Connect to your enterprise backends and APIs with 1000s of pre-built data connectors



Build & Publish

Customize topics, and actions

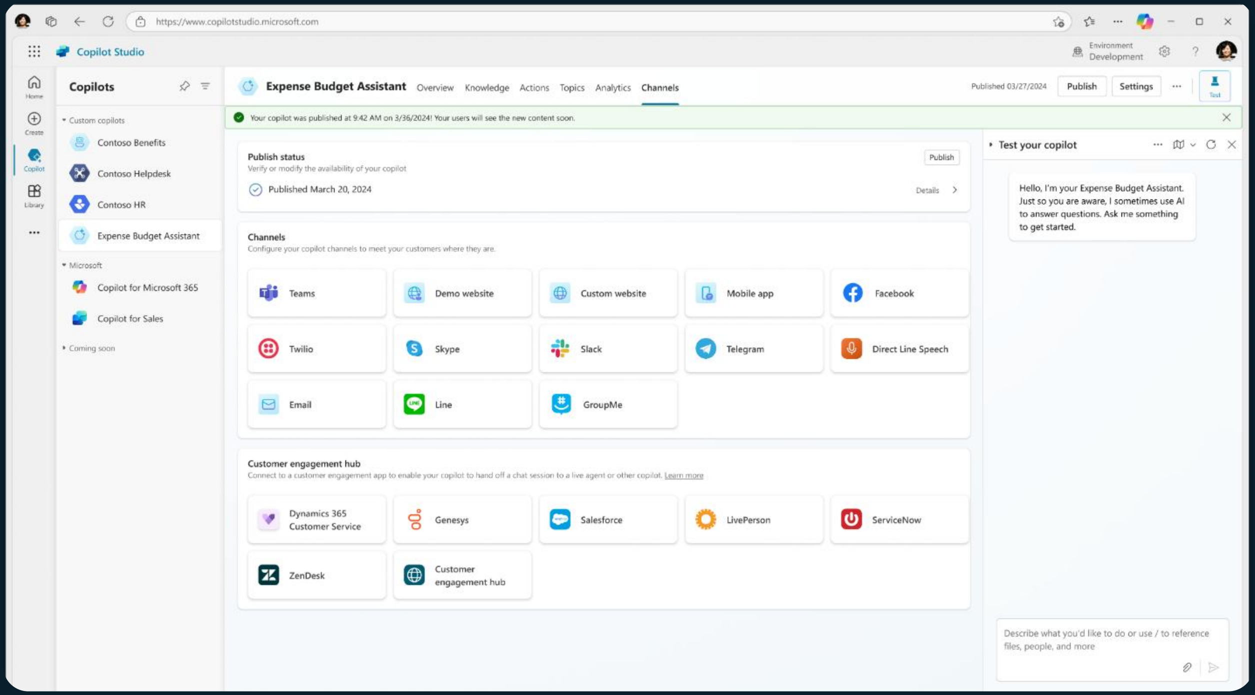
Mix generative responses with step by step topics for complete control. Create actions, plugins and connect to your backend systems with 1000s of pre-built connectors



Build & Publish

Publish and go live instantly

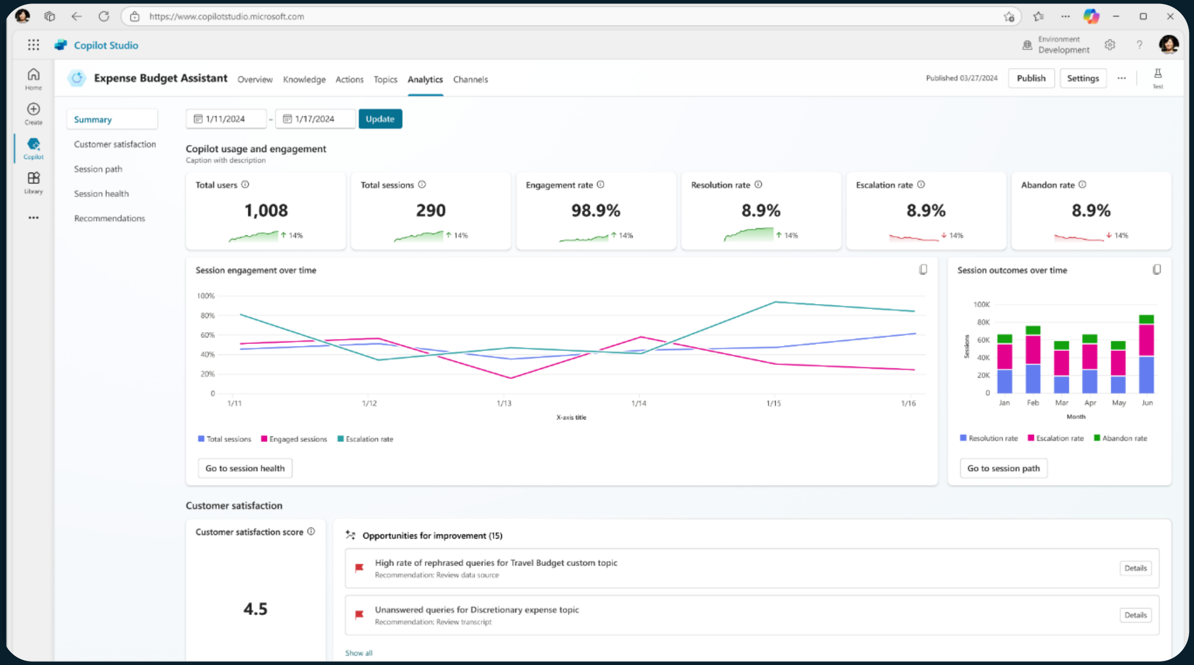
Publish and deploy to the channel of choice with a single click, and your copilot is live.



Analyze & Improve

Monitor and get insights

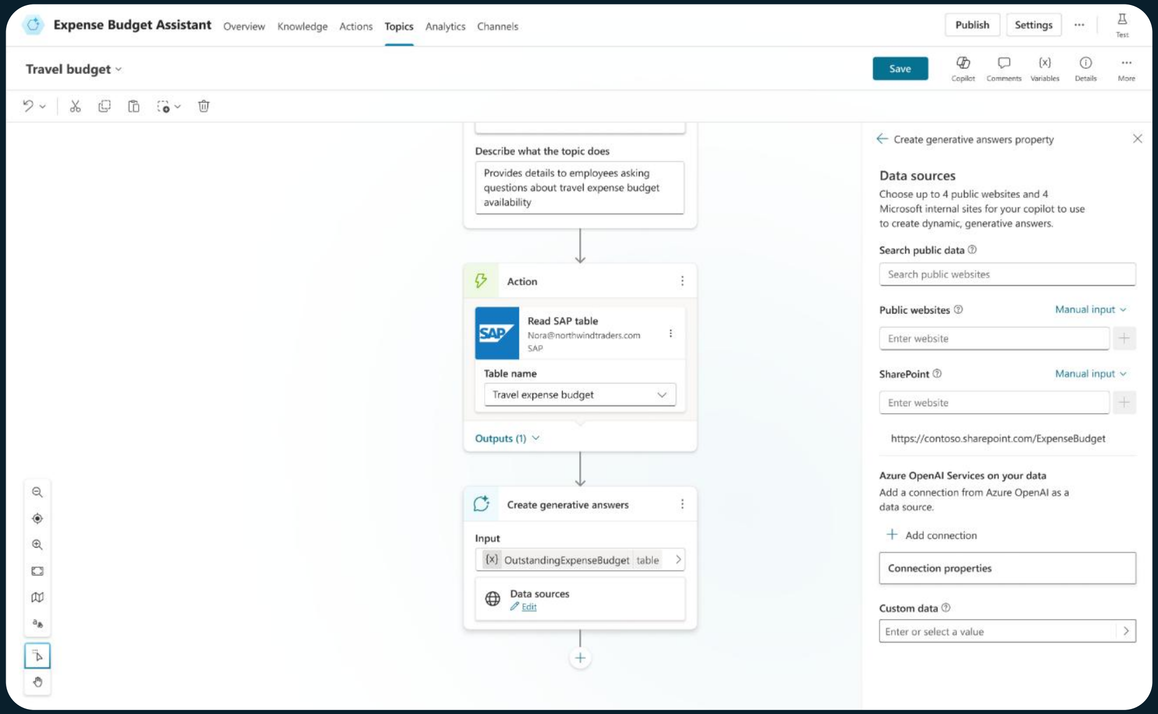
Understand what's working well and what needs to improve with conversational analytics



Analyze & Improve

Fine tune to add sophistication

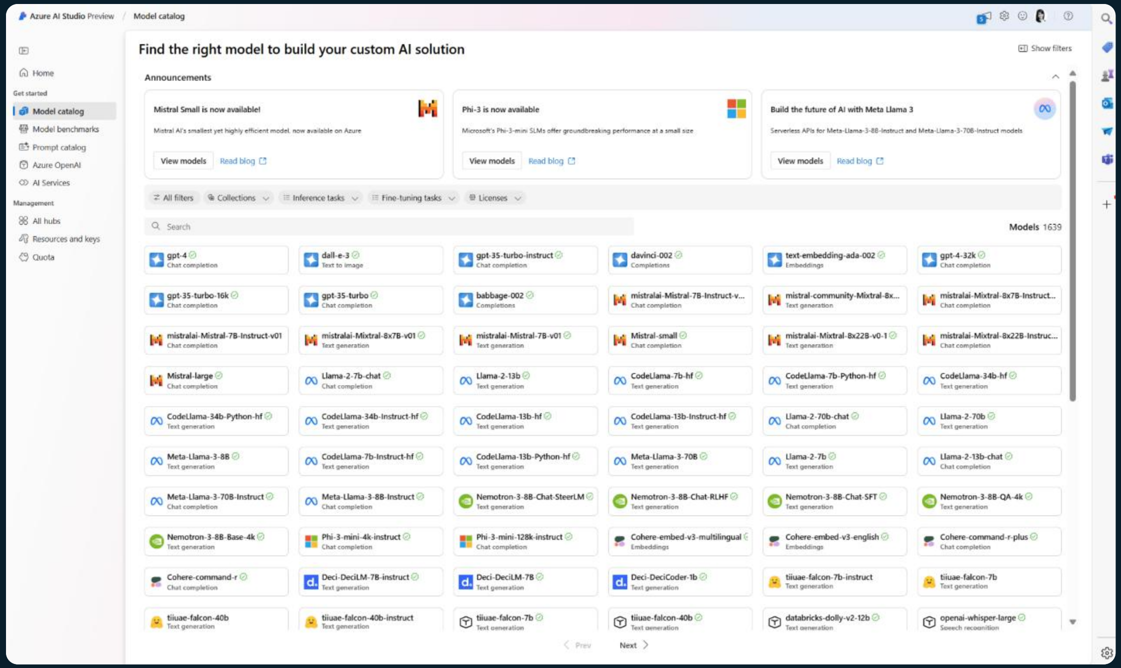
Layer in more topics with custom responses and conditions based on insights generated to improve your copilot's performance.



Analyze & Improve

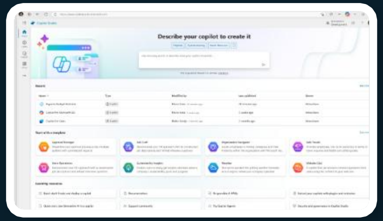
Add Conversational Services

Integrate with Azure AI Studio, Azure Cognitive Services, Bot Framework and a variety of other Microsoft conversational services



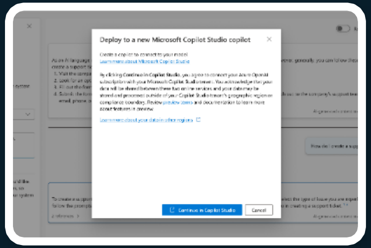
Create, manage, publish and extend Copilots

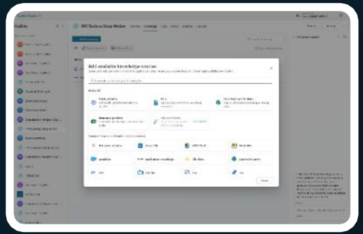
Live in minutes - all from one tool
and E2E SaaS service



Integrate with AI Services

Integrate with Azure AI Studio, Azure Cog Services, Bot Framework and various other Microsoft conversational services





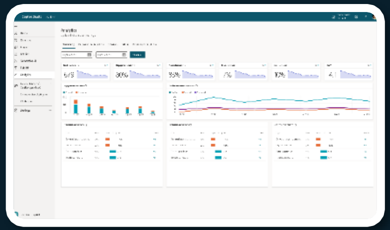
Chat over knowledge with Gen AI

Get enterprise specific answers over your files, websites, internal shares, Dataverse, third party systems and more

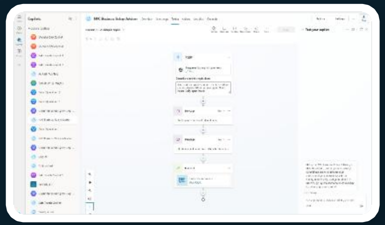
Build & Publish

Monitor and Improve

with rich out-of-the-box insights and analytics



Copilot Studio

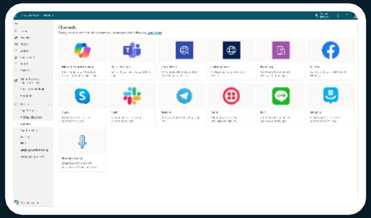


Create specific topics

Supplement generative responses with specific, curated topics where you want tight control. Build them easily with the powerful graphical studio

Publish to multiple channels,

and go live instantly on the SaaS service or choose to extend Copilot for Microsoft 365 with your custom capabilities



Analyze & Improve

Build actions & Plugins

Create actions, plugins, use 1000s of pre-built connectors or Power Automate to call your backends and APIs

Example use cases to build copilots today:

B2C

Customer Support

Handle routine customer inquiries, providing instant responses and freeing up human agents for more complex issues.

Ask your copilot

How do I return a product?

How do I reset my account information?

Products/Services

Assist customers with product and service discovery based off your website.

Ask your copilot

What is the latest laptop? Can I fit it in my 15" backpack?

B2B

Supplier Interaction

Facilitate communication between businesses and their suppliers, managing orders and track shipments.

Ask your copilot

What's the status of our latest component order?

Lead qualification

Qualify leads by asking relevant questions and then route them to the appropriate sales representative.

Ask your copilot

Can you provide me with information on your bulk pricing for office supplies?

B2E

Build your own copilot

Human Resources

Interface with your ERP/HR systems to simplify processes.

Ask your copilot

Start the onboarding process and required tasks for new colleague

Extensibility

Expense Management

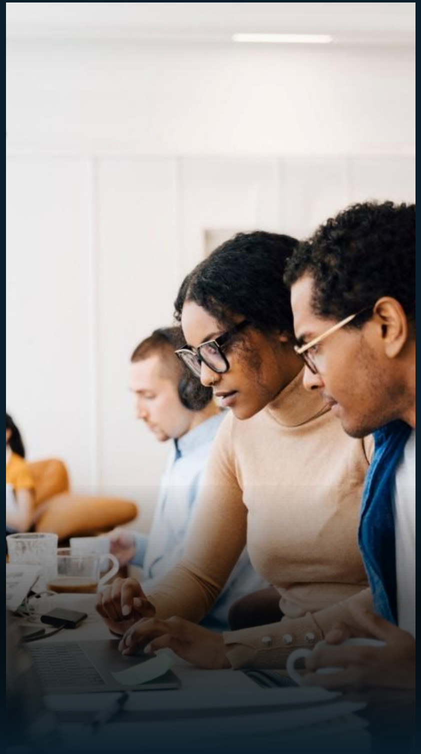
Interface with your ERP systems to streamline your finance or resource planning processes.

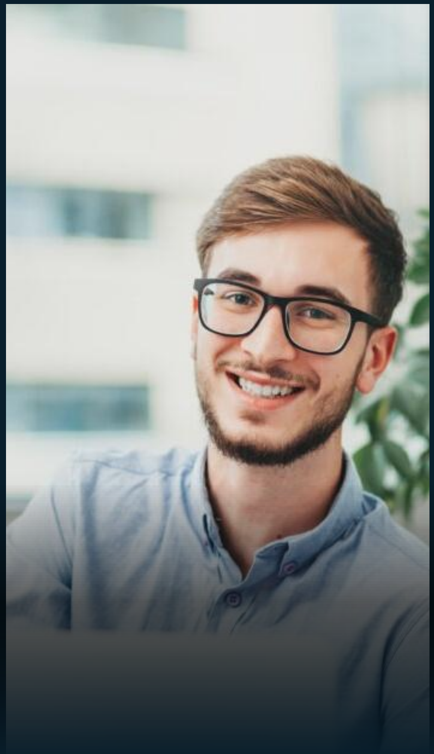
Ask Copilot

Send me a list of pending expenses from this week.

More than 30,000 customers across every industry have used Copilot Studio

to help improve performance and efficiency while reducing costs and risks





Rabobank

Conversational banking copilot on both telephony and digital channels

PayPal

HR/IT copilot for employees that reduced support costs and workload

Holland America Line

Helping customers find and book the perfect cruise

accenture

Creating customer focused copilots as a Microsoft Partner

hp

Customer copilot to help find the right products and support

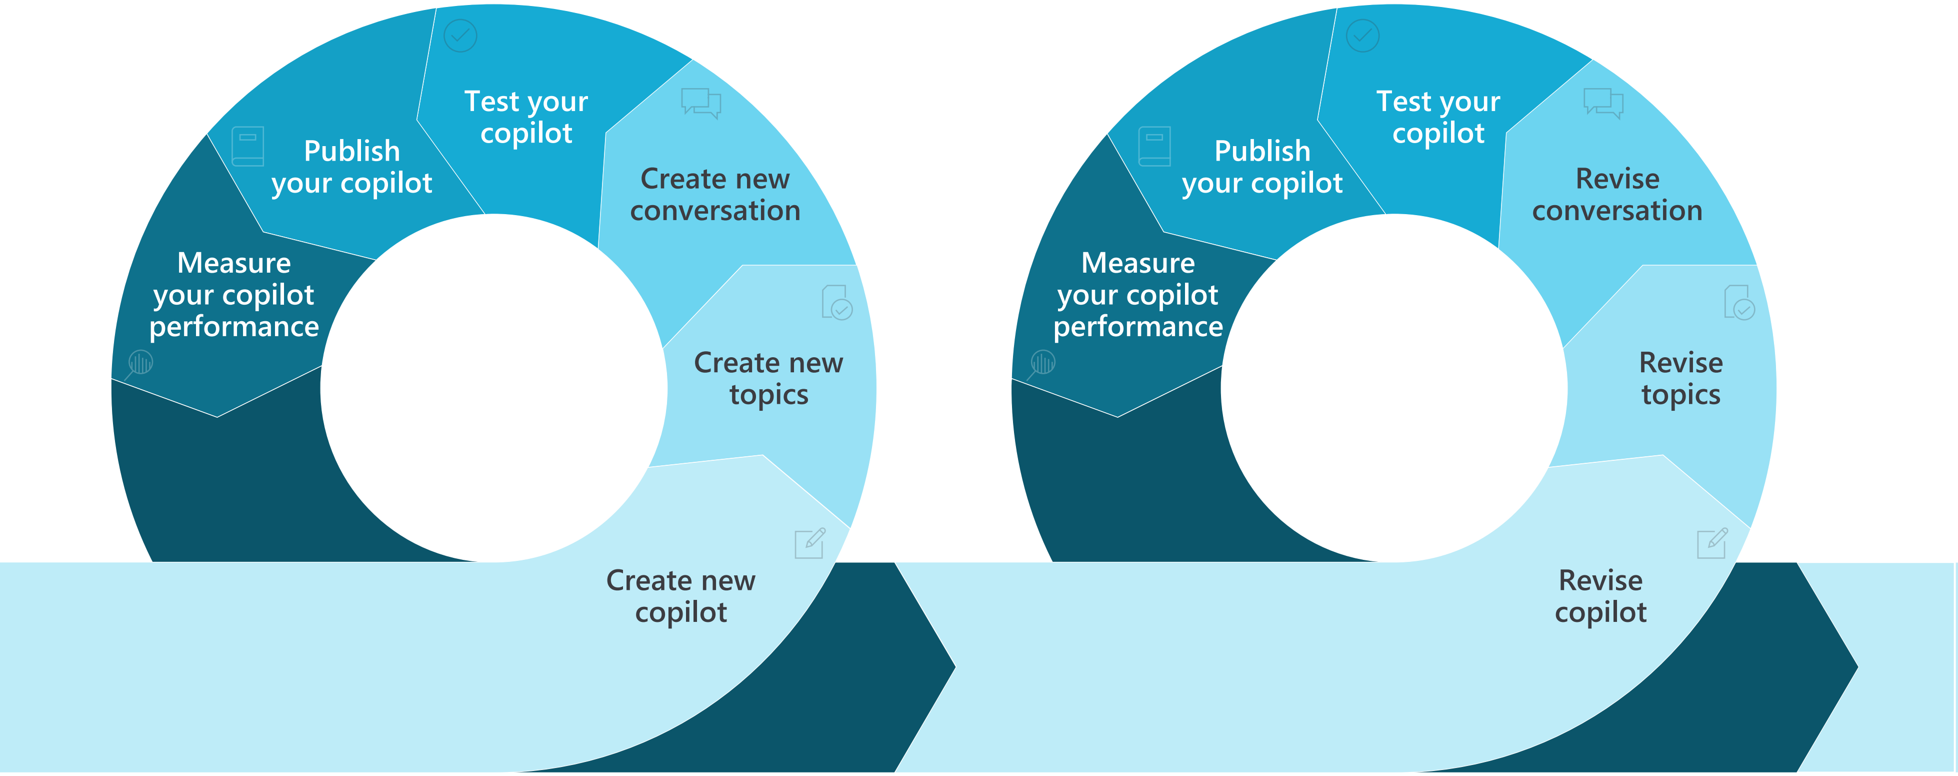
CINEPLEX

Copilot that helps with customer service for guests

Demo – Stand-alone agent

Oppgave 2 – Stand-alone agent

Copilot Creation Process overview



Instructions / Prompt engineering

Demoer – instructions / prompt engineering

Oppgave 3 – instruksjoner / Prompt engineering

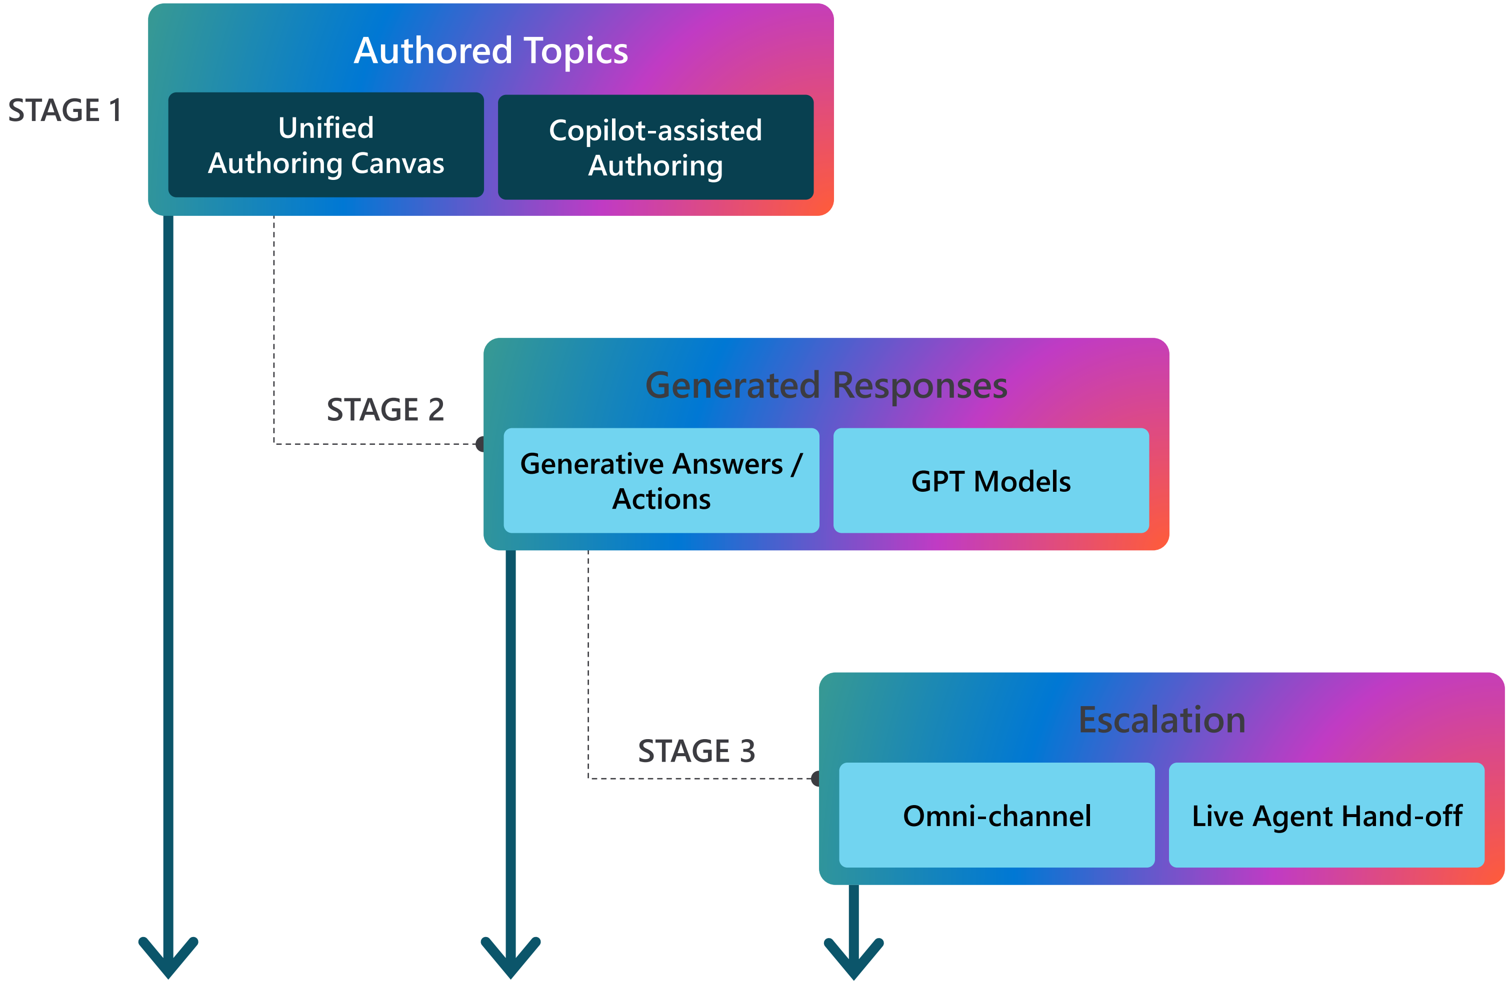
The end-to-end copilot conversation

1. Authored Topics
Organizations control their critical topics by designing their own specific processes and workflows.

2. Generated Responses
Generative AI answers queries at scale that may be duplicative or less complex.

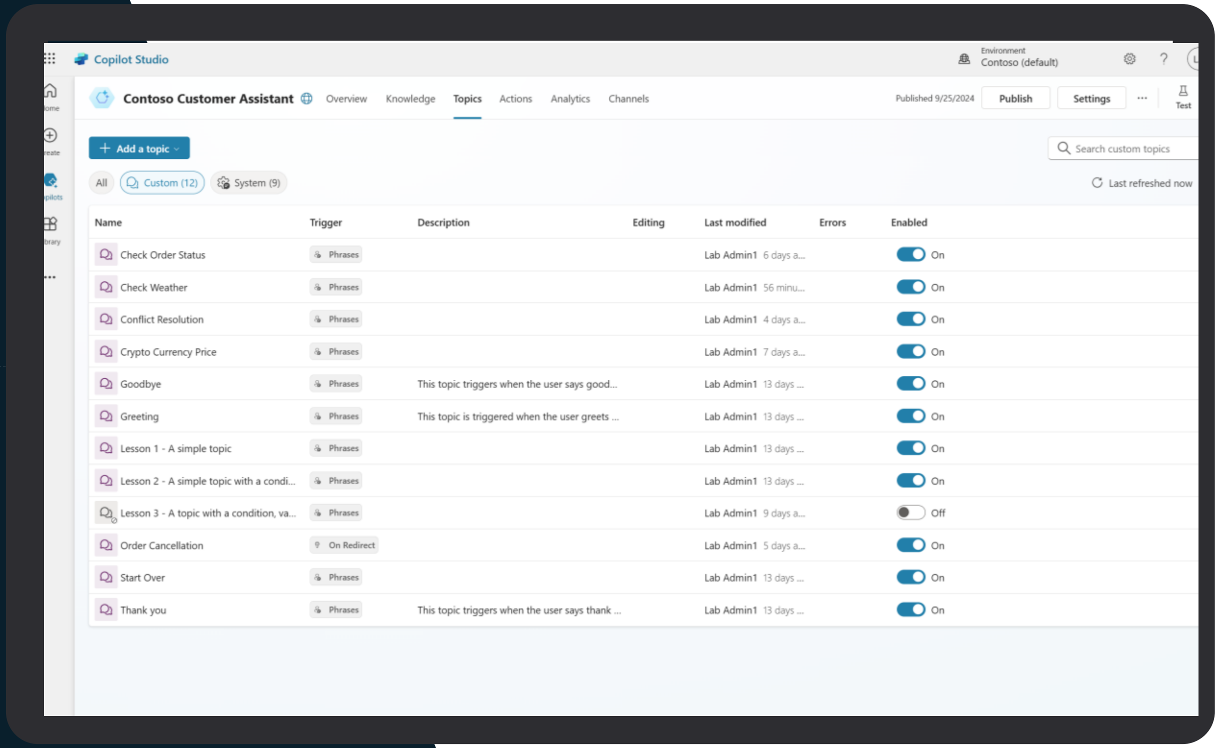
3. Escalation
If the copilot can't handle the conversation, it will escalate the conversation to a human assistant.

Copilot Studio Dialog Management



View topics

- A copilot comes with 4-7 User topics & 8 system topics
- Using one of the 4 topics to get familiar with the structure

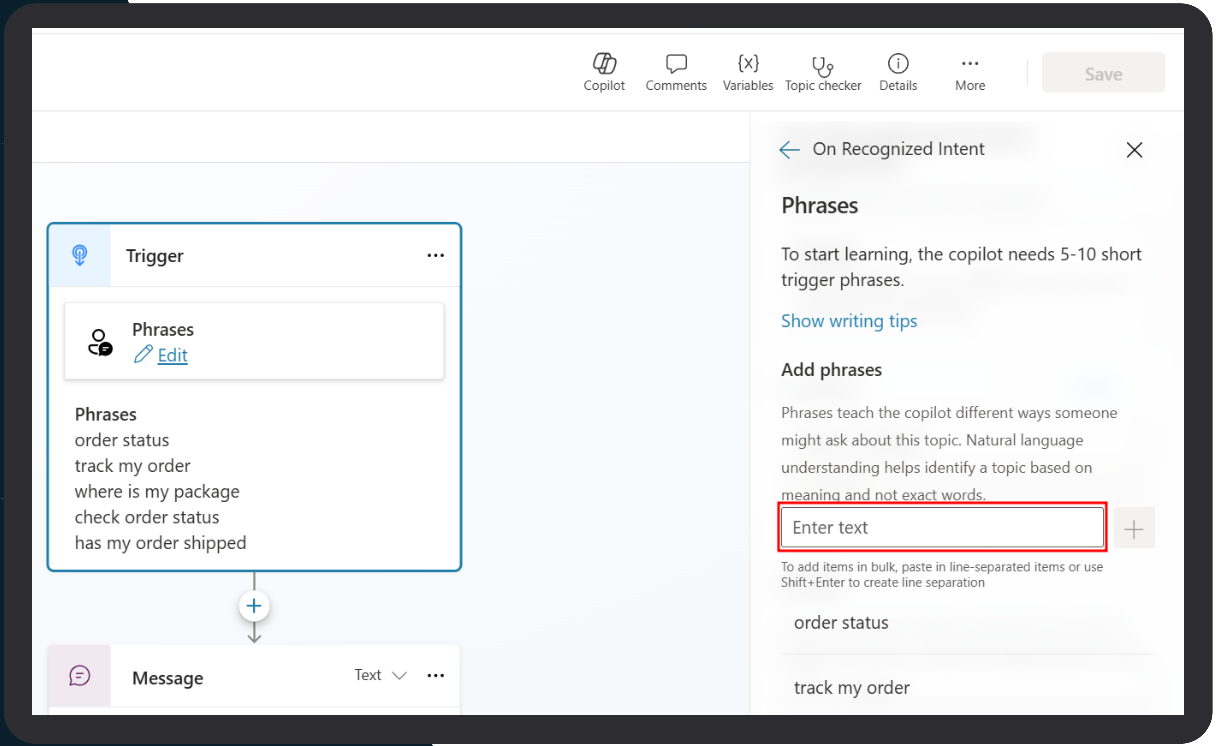


Add conversational trigger phrases

For a topic you'll define a few trigger phrases

A trigger phrase is a way to describe an intent, it captures the way a customer might ask about a problem/issue. E.g., "problem with weeds in lawn"

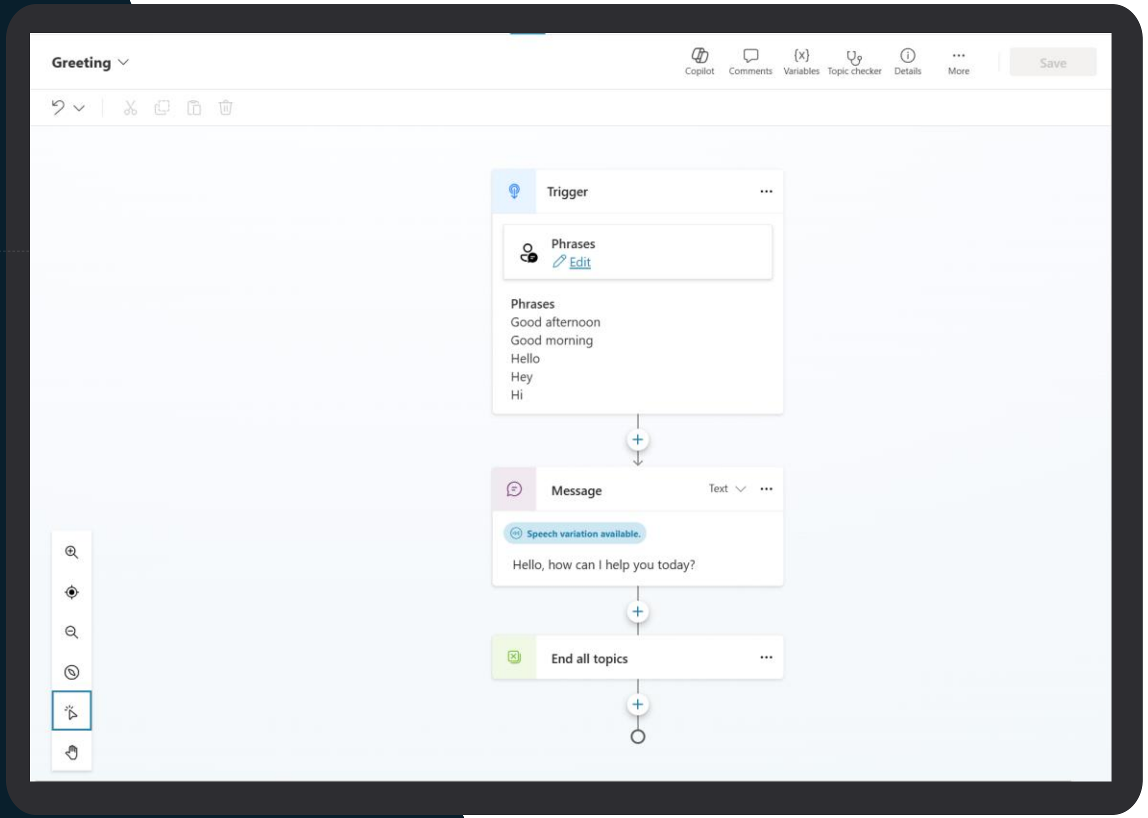
You only need to provide at least 5 phrases – the AI will parse whatever the user says and trigger the topic closest in meaning to the user utterance



Open the authoring canvas and begin editing a topic

Open the authoring canvas to view the conversation tree

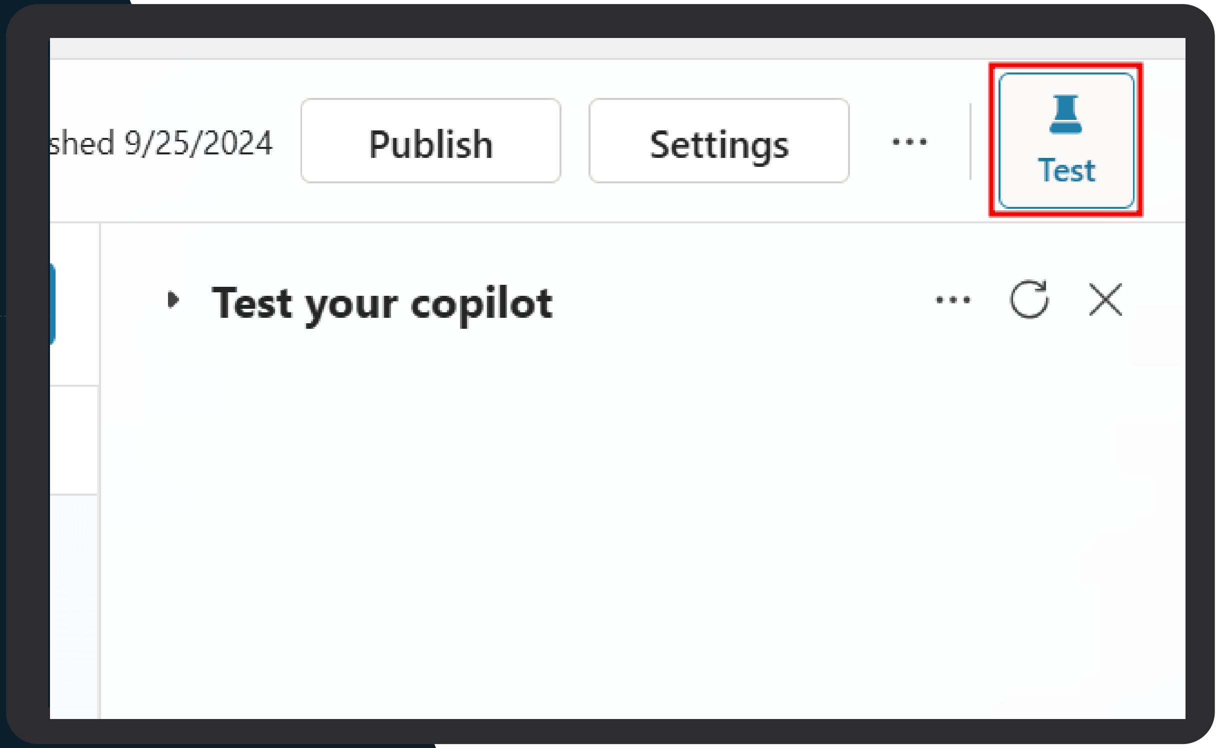
You’ll see the trigger phrases at the top. You can edit the conversation tree, adding questions the copilot should ask, things the copilot should say etc.



Test your topic as you construct it

To test what you've created click on Test (top right) to expand the test window

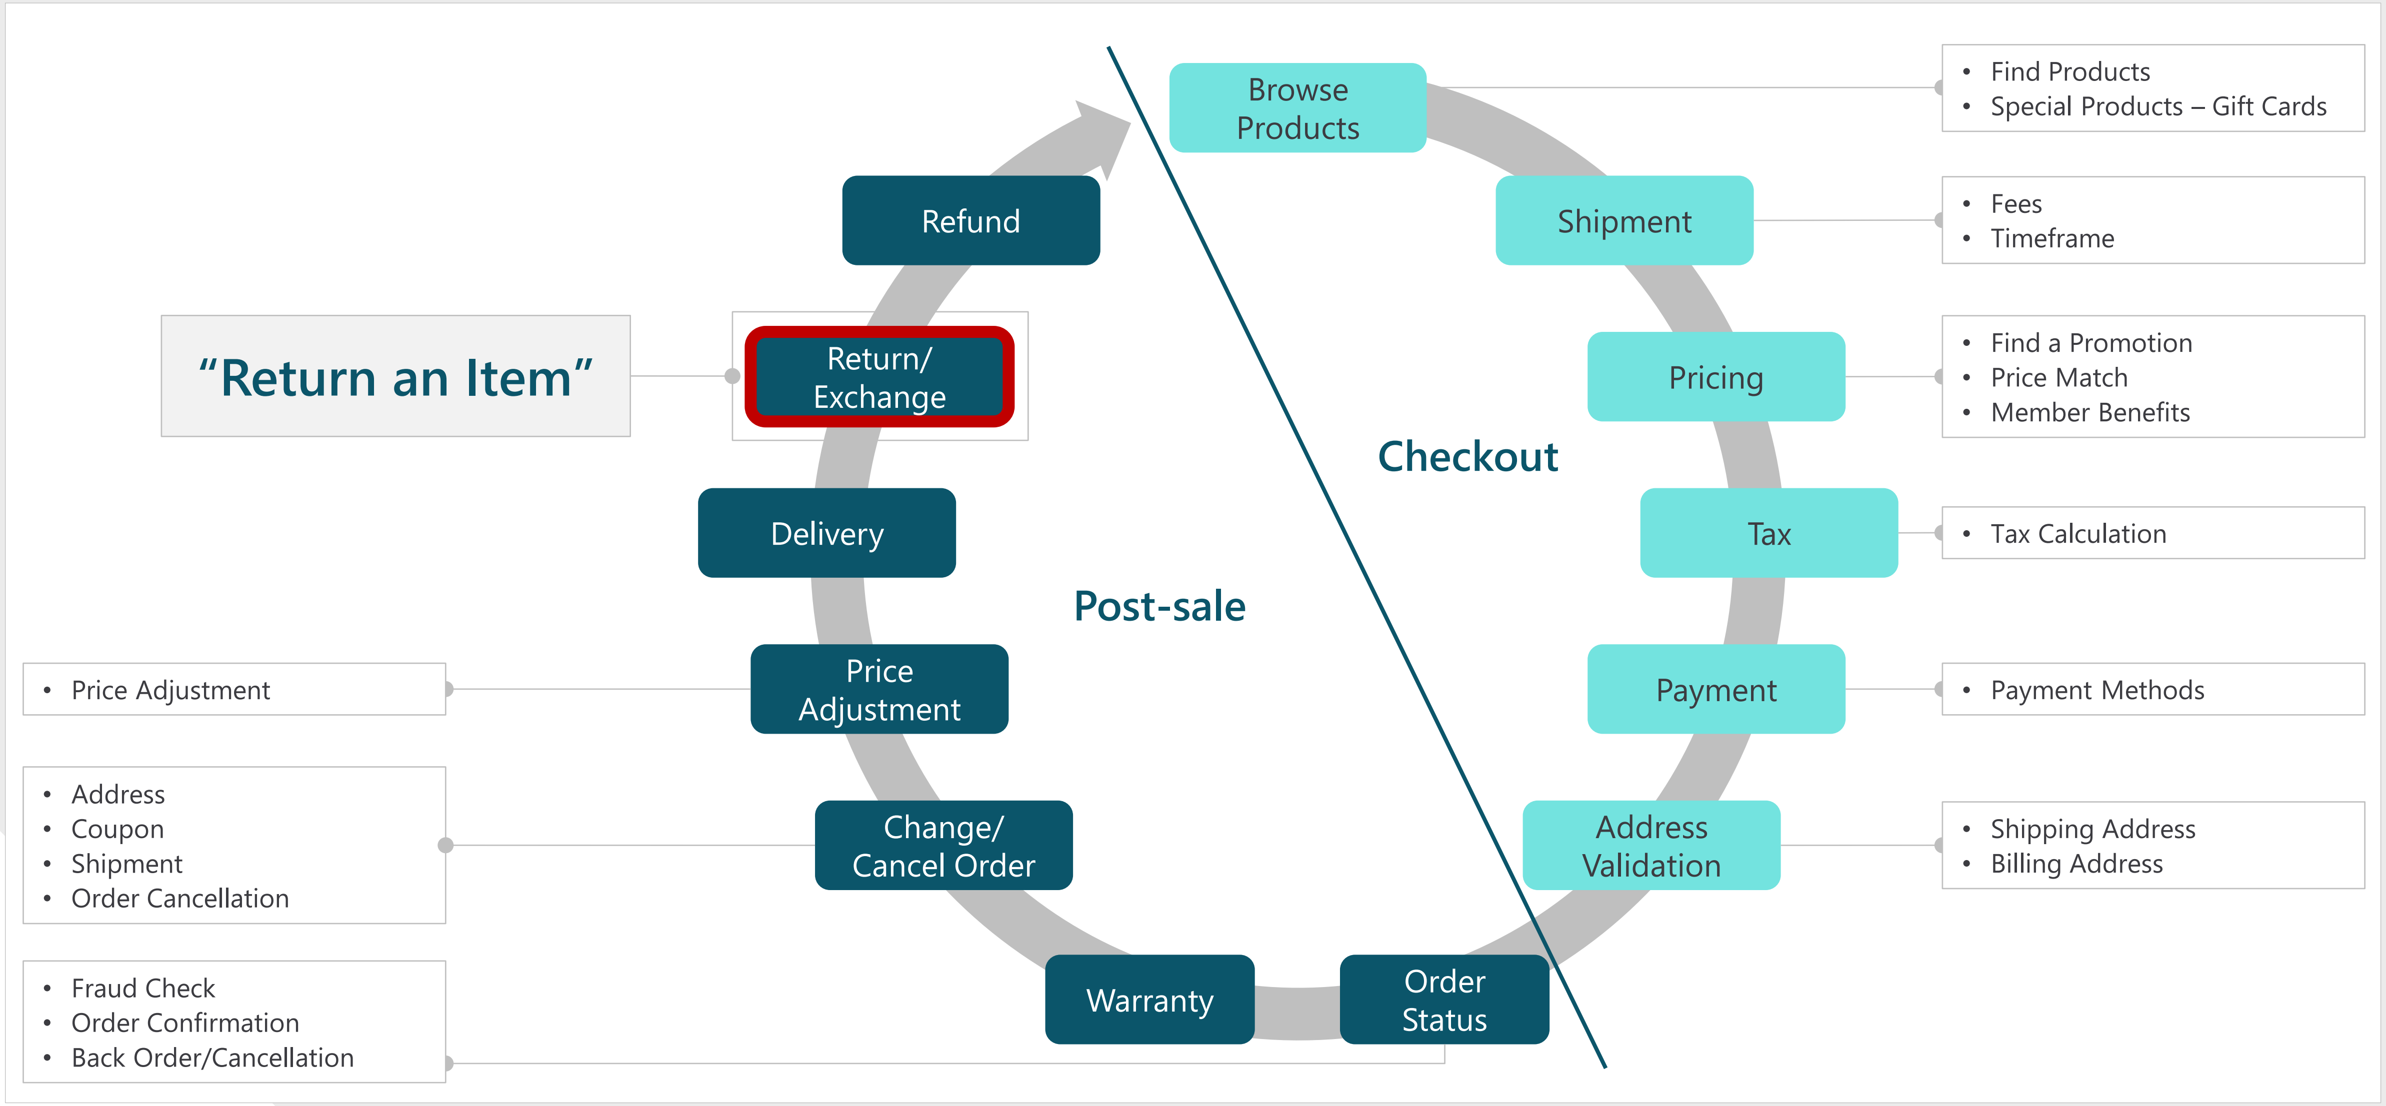
Turn on "Track between topics". This lets you trace your way through both this topic and any others you call



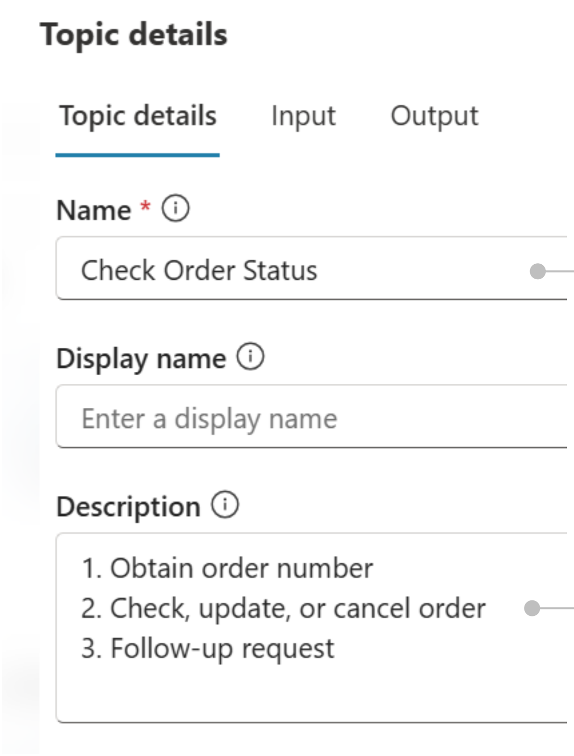
Microsoft

Best practices for writing topic trigger phrases

Step 1: Pick a topic



Step 2: Define the goal for the topic



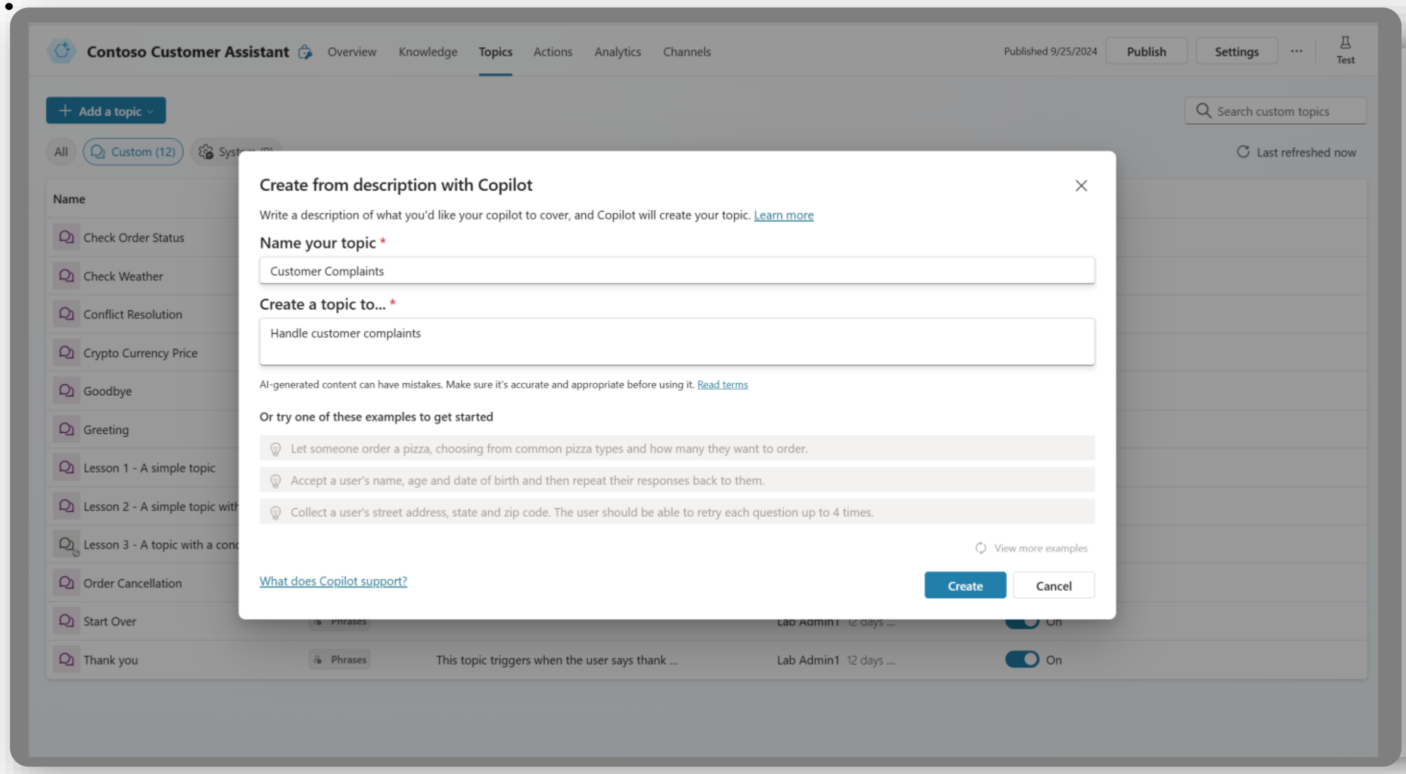
Topic: "Check Order Status"

Goal:

1. Obtain order number
2. Check, update, or cancel order
3. Follow-up request

Creating a Topic with Copilot

AI assistance in building topics, designing and modifying the copilot all through natural language.



Assisted authoring for:

- Topic creation
- Topic iteration
- Response generation
- Adaptive Card generation
- Topic improvement suggestions
- Suggested trigger phrases, topic names, topic descriptions
- Transcript generation
- Copilot creation
- Topic suggestions

Azure copilots take months to author.

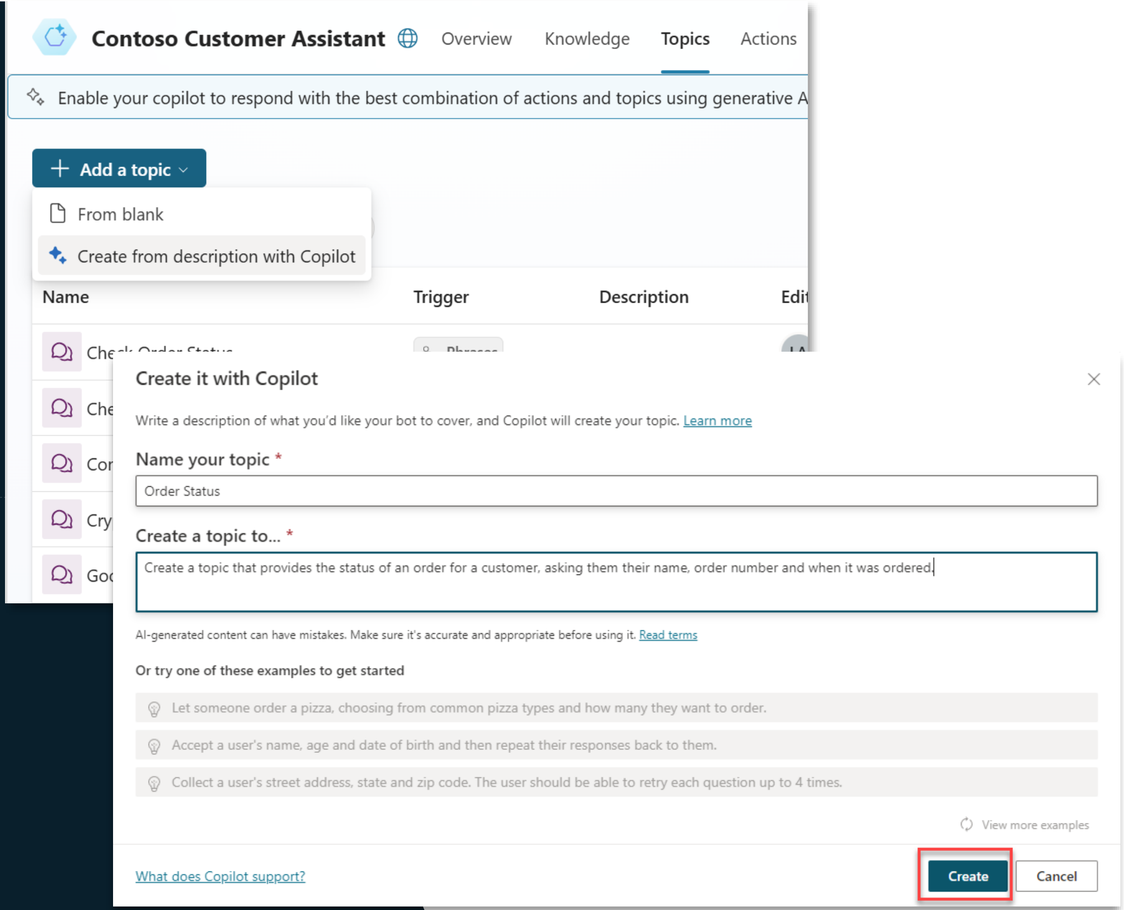
Copilots took days to author.

Prompt-authored solutions will take hours, or even minutes to author.

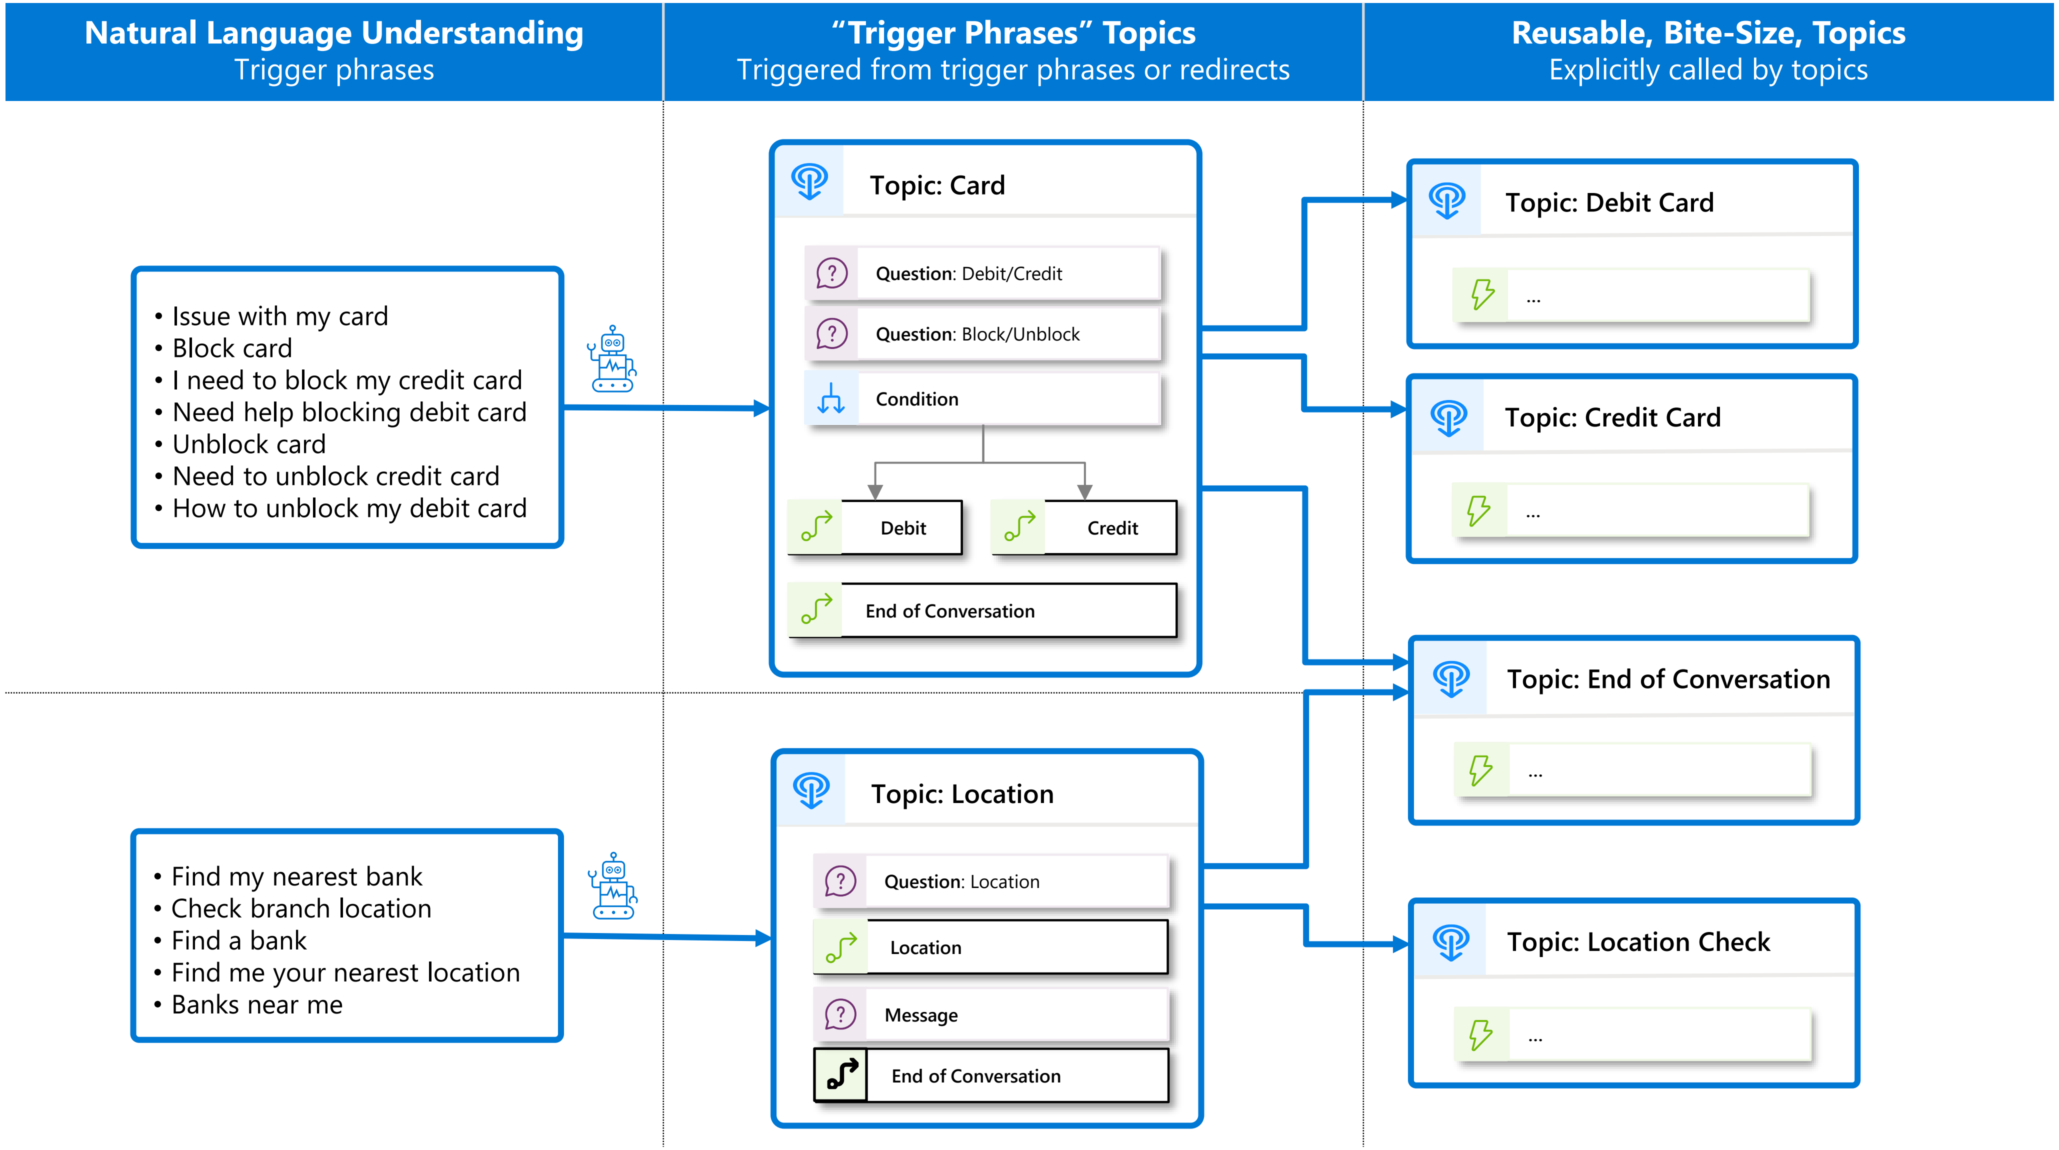
Creating a Topic with Copilot

Create topics using Natural Language to describe what you need the topic to do

Reduce manual steps of creation and iterate using Copilot too!



Disambiguation with topic design



Handling unrecognized intents

Answering for unplanned user queries

1

The fallback topic gets triggered when Copilot Studio doesn't understand a user utterance and doesn’t have sufficient confidence to trigger any of the existing topics.

2

There are many ways to handle unrecognized intents: using the AI’s own general knowledge, or knowledge sources to ground the answer in your own data sources and/or using the Fallback topic to integrate with any other systems.
For example, question answering in Azure AI for Language allows you to offload large volumes of question-and-answer pairs. It also has a chitchat model to handle random questions to the copilot.

3

If knowledge sources are enabled on the copilot, the conversational boosting topic also triggers on the unknown intent event and triggers before the Fallback one.

4

While it’s important to leverage the Conversational Boosting and Fallback capabilities, it’s also important to make sure that the core scenarios and topics of your copilots are property handled through custom topics and their outcomes defined (resolved, etc.).

System topics

Topic Name	Trigger Condition	Purpose
Conversation Start	First user interaction	Greets and introduces the agent
Fallback	No topic match	Prompts user to rephrase or escalates
Escalate	“Talk to agent” or failed responses	Transfers to human agent
End of Conversation	Manual redirection	Gracefully ends the session
Multiple Topics Matched	Ambiguous user input	Prompts user to choose a topic
On Error	User-side error	Displays error message with debug info
Conversational Boosting	No match + external data available	Uses generative AI to answer [Use system...soft Learn], [Configure...lot Studio]

- https://learn.microsoft.com/en-us/microsoft-copilot-studio/authoring-system-topics?tabs=webApp

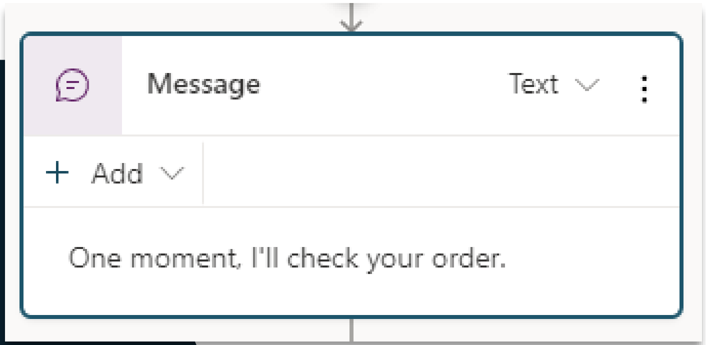
System topics – best practices

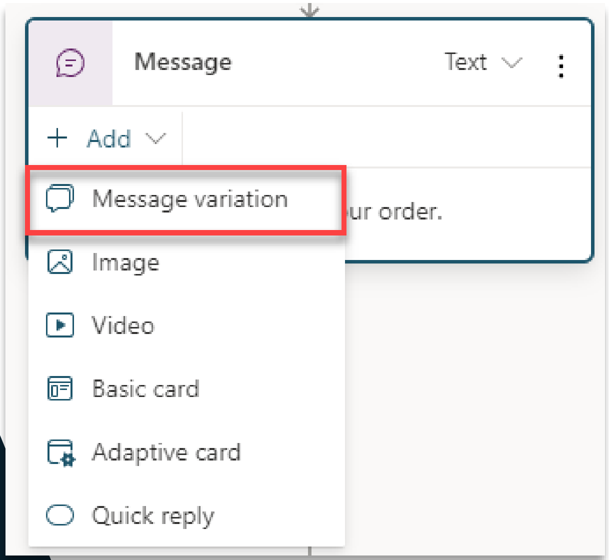
- Start with default system topics before customizing
- Use **generative orchestration** for flexible topic triggering
- Test fallback and escalation flows thoroughly
- Avoid editing system topics until you're confident with agent design

The Message Node

The Message Node is one of the most common nodes used when authoring copilots

It allows you to display standard text, formatted text and dynamic data in the conversation

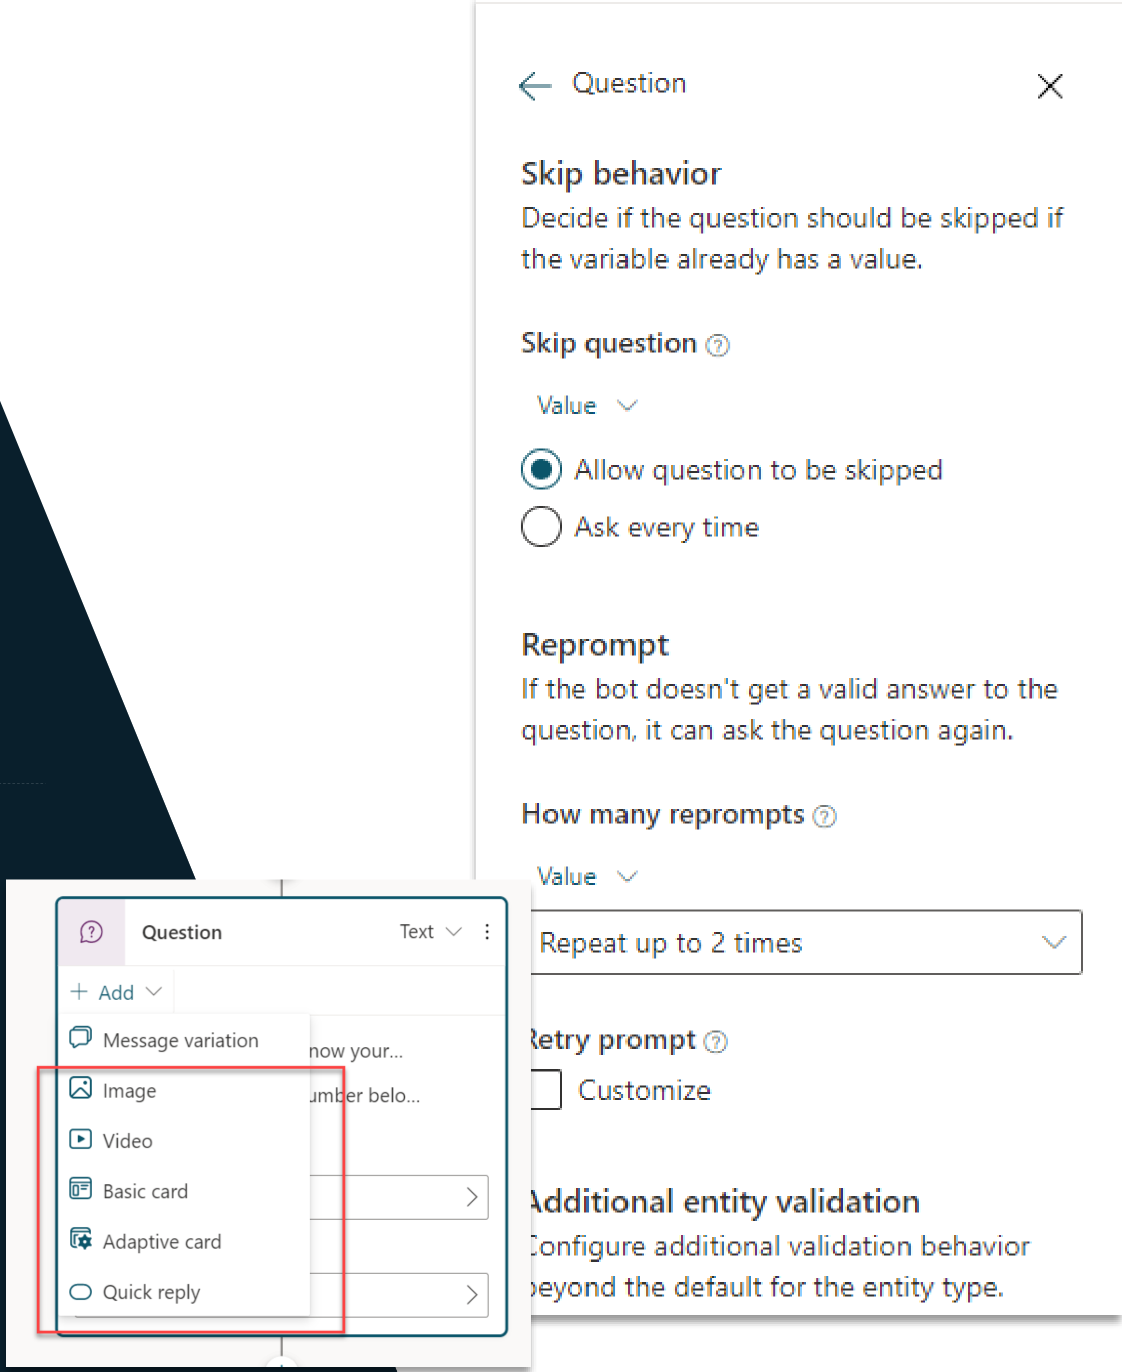




The Question Node

The Question Node is another of the most common nodes used when authoring copilots

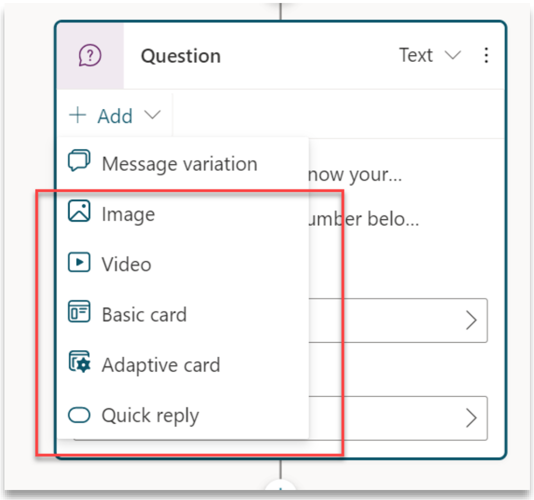
It provides capability to ask the user a question and store the data to be used and operated upon

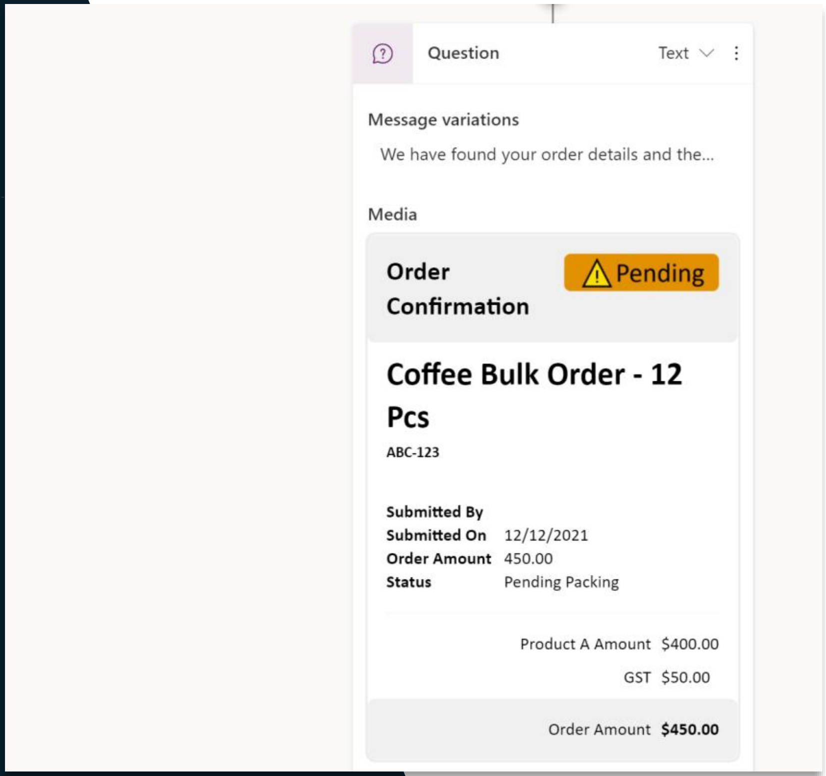


Rich Text Responses

Brand new rich text response options including image and adaptive card

Deliver enhanced experiences to customers and users which are more engaging and display data in more dynamic ways

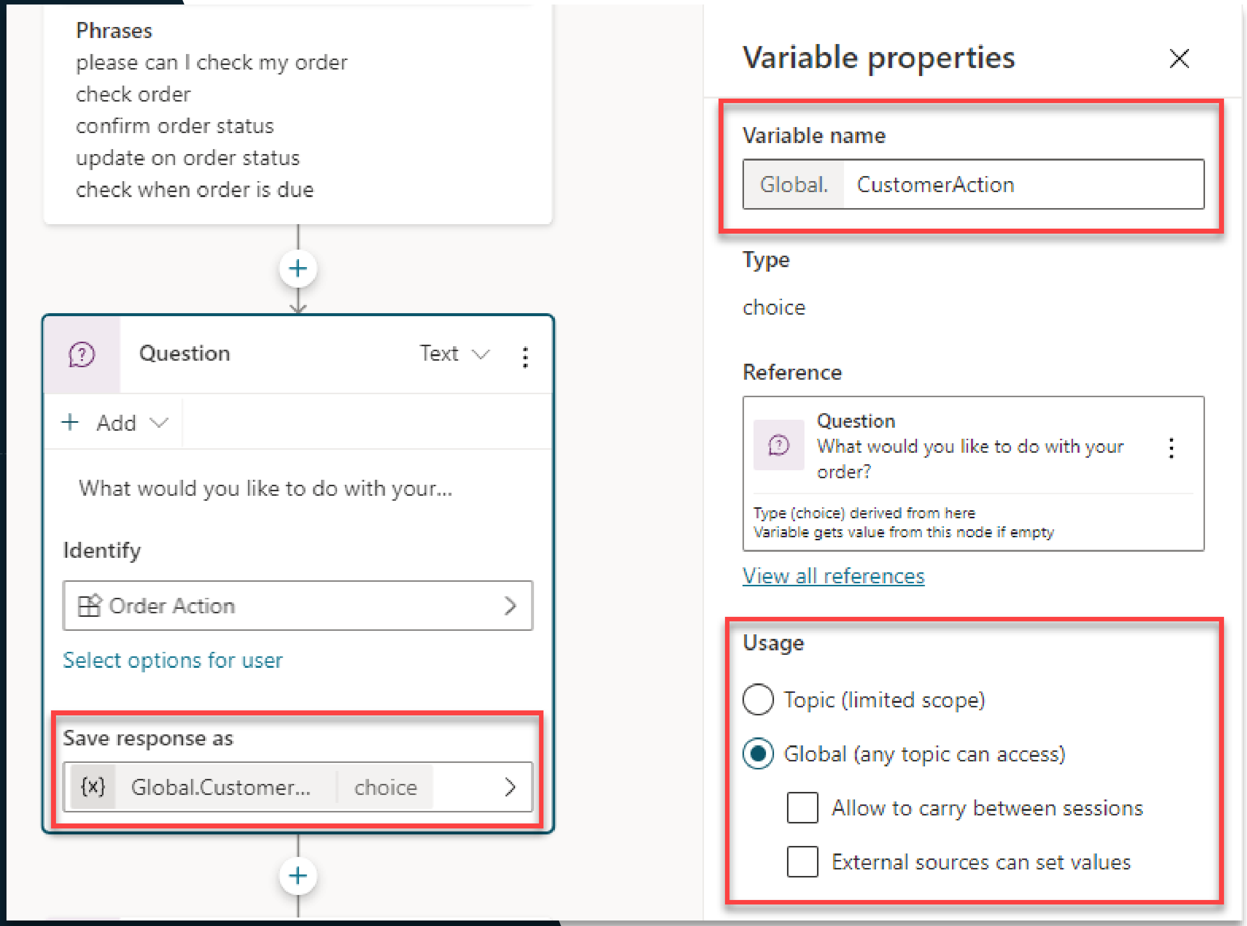




Use variables to navigate customers to tailored content

Direct your customers to content you want them to see

Add variables to keep customer information for later in the conversation

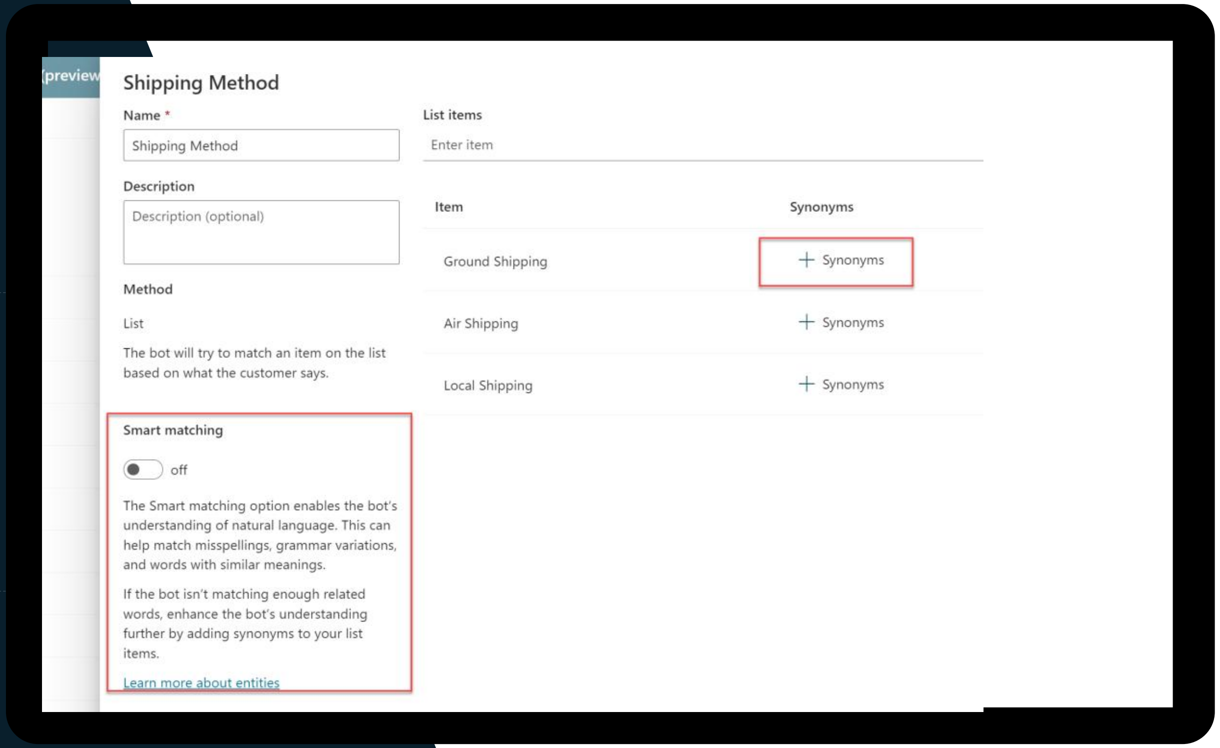


Entities and Slot-filling capabilities

Copilots can intelligently avoid repetitive conversations

Enhances your efficiency as a maker

Copilots can guide you to making the best experience

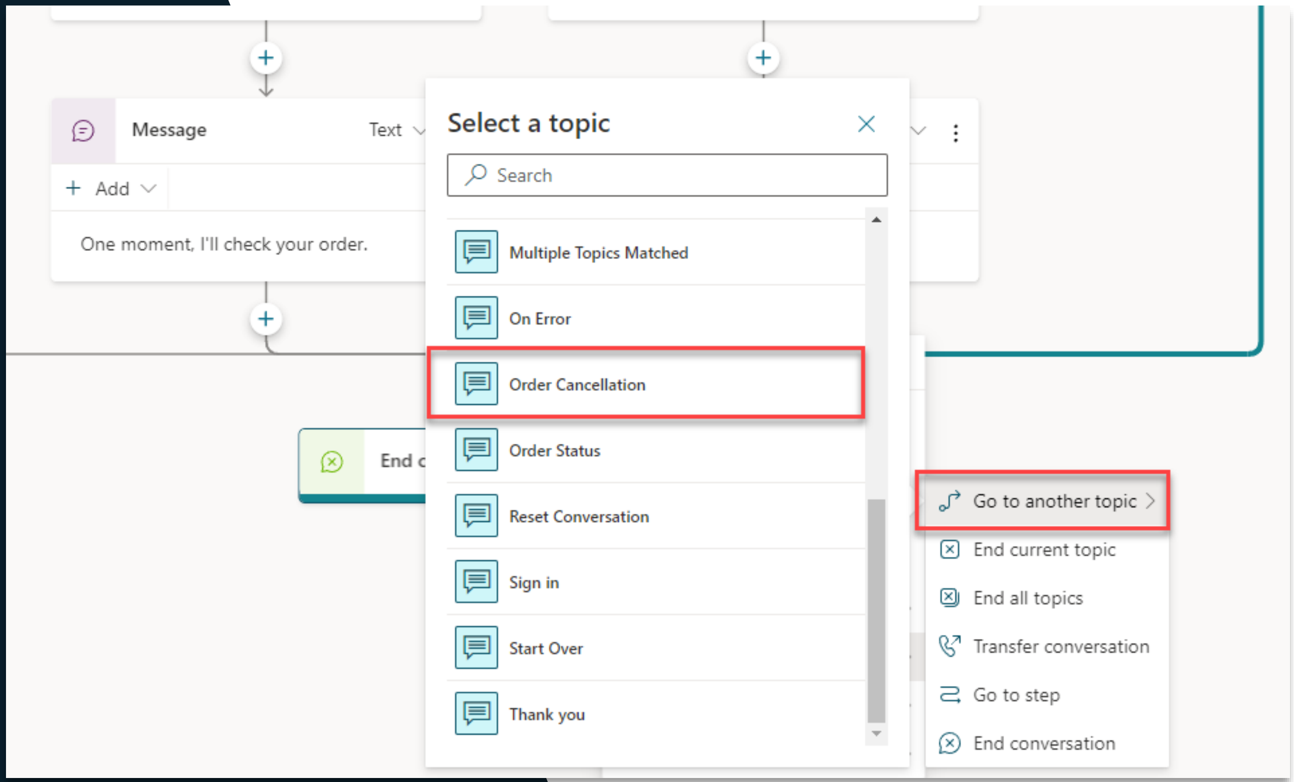


Topic Management

Re-direct and connect customers to related topics

Use it when:

A conversation requires more than one topic, such as when you need to ask a clarifying question to determine which topic the user needs



Demo - Topics

Oppave 4 – Topics

Microsoft

Copilot Studio

Your copilot, your way

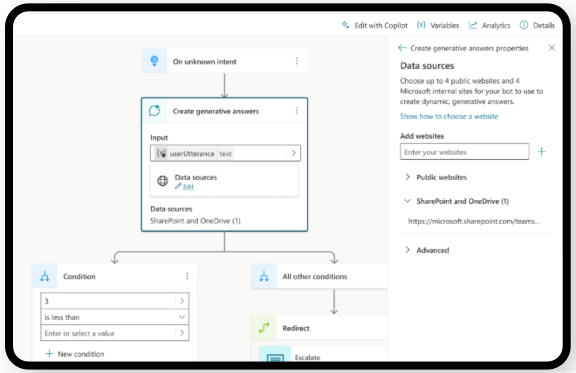
Add knowledge sources to a copilot

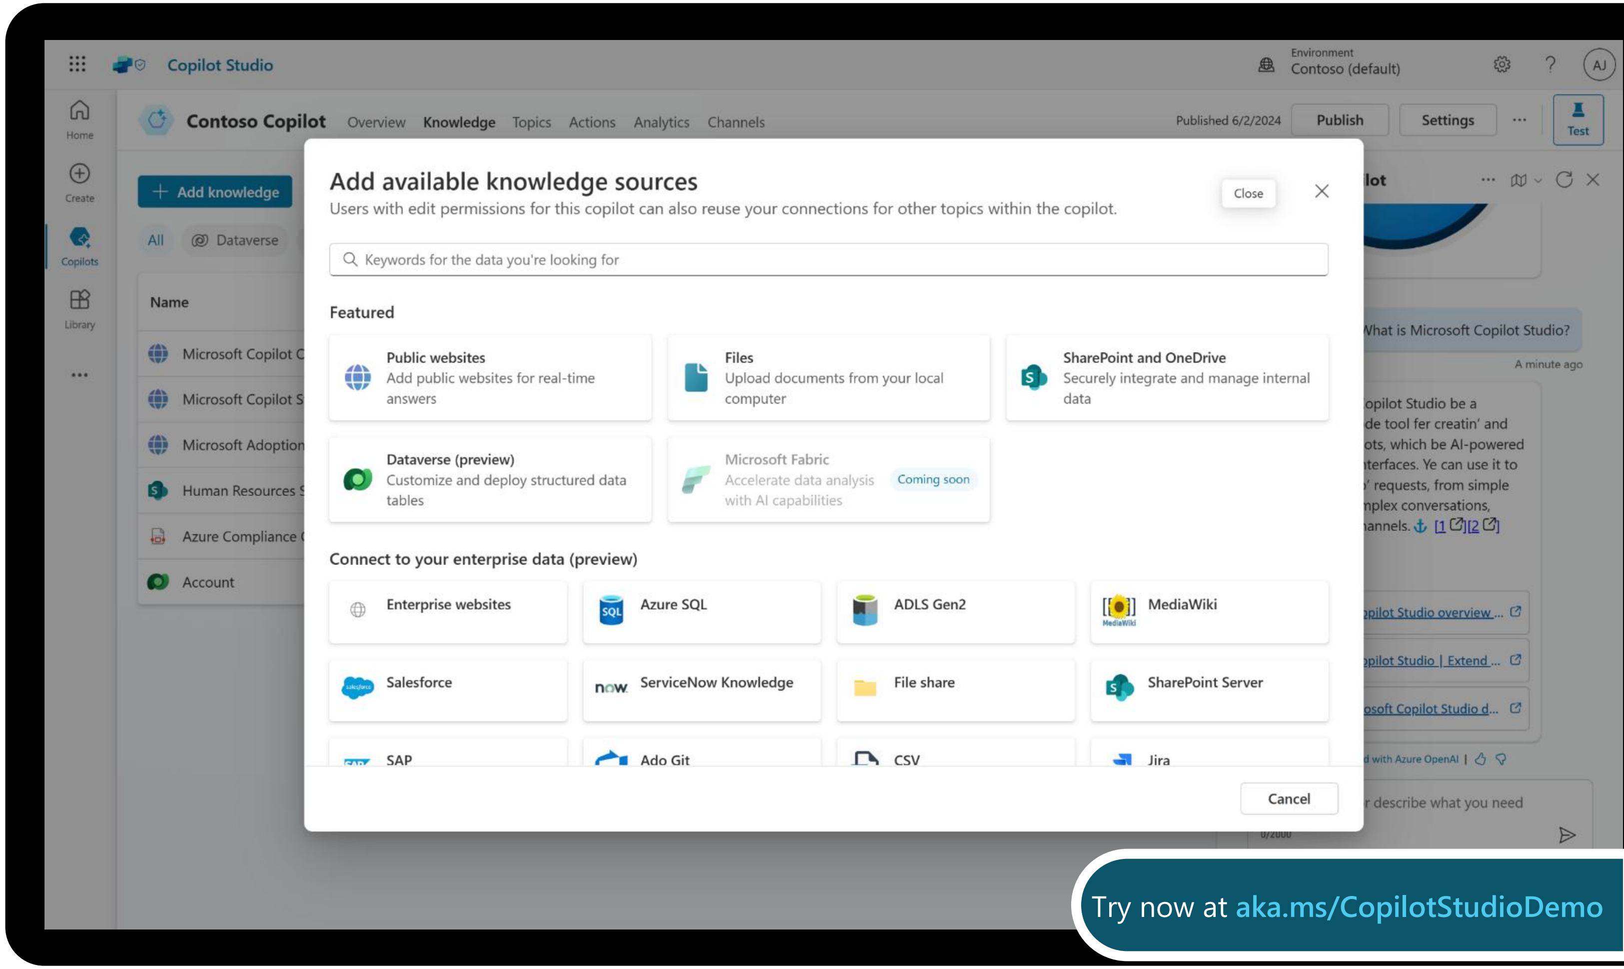
Knowledge sources

Enable multi-turn chat over your own internal and external knowledge sources and sites with generative answers

Copilots can answer thousands of questions out of the box in seconds

You can even pull data from an API or other backend system and enable generative chat over it





Try now at aka.ms/CopilotStudioDemo

Knowledge sources & Generative AI

1. Query rewriting

- Optimizing the user question for search
- Last 10 turns are leveraged for contextualization

2. Content retrieval

- Querying each source
- Top 3 results per source

3. Summarization

- Answer summarization from retrieved content
- Citation generation
- Answer personalization with custom instructions

Validation at each step

- Moderation of harmful, malicious, uncompliant, or copyrighted answers
- Grounding validation and hallucination removal

Public data

- Websites must be indexed by Bing.
- Bing being a global service, no regional boundary is possible.

Public Website	• Up to 4 URLs, but the list can be dynamic. • Max 2 subpages depth (/en/help/), no direct pages.
Bing Custom Search	• One configuration ID, but it can be set using a formula. • Azure costs covered by Microsoft • Up to 400 URLs, custom ranking options. • Max 2 subpages depth (/en/help/), supports direct pages.

SharePoint

Internal only

- Requires the user to be authenticated with Entra ID to make delegated calls to the Graph API.
- Matching files (max 3 MB) are retrieved to get detailed snippets to summarize.
- Up to 4 SharePoint or OneDrive for Business sites (but the list can be dynamic).
- Security trimming: returned results only include content the user has read access to.
- Users eligible to Microsoft 365 Semantic Index benefit from better results.

Azure OpenAI on your data

preview

- Returns results from the linked Azure AI Search index (keyword, semantic, and vector search).
- Not a passthrough to Azure OpenAI – generative answers summarization and validation apply.
- Connection isn't delegated: no security trimming, no authentication requirement for the user.
- Can index content from public URLs/web addresses (useful if regional boundary is required).

Files

- Files (max 3 MB) are stored in Dataverse file storage and indexed with Dataverse Search.
- Not possible to offer a URL to the source documents in the citations.
- Documents are uploaded at the copilot level. Gen Answers node will search across all uploaded documents or none, when disabled at a node level.

Custom data

- Requires a step to query the data source – using cloud flows, connectors, or HTTP requests.
- Results are passed as inputs to the generative answers to summarize an answer for the query.
- Input data needs to be in table format, with 3 properties: Content (typically snippets of relevant content) , ContentLocation (optional, typically a URL) and Title (optional).

Dataverse

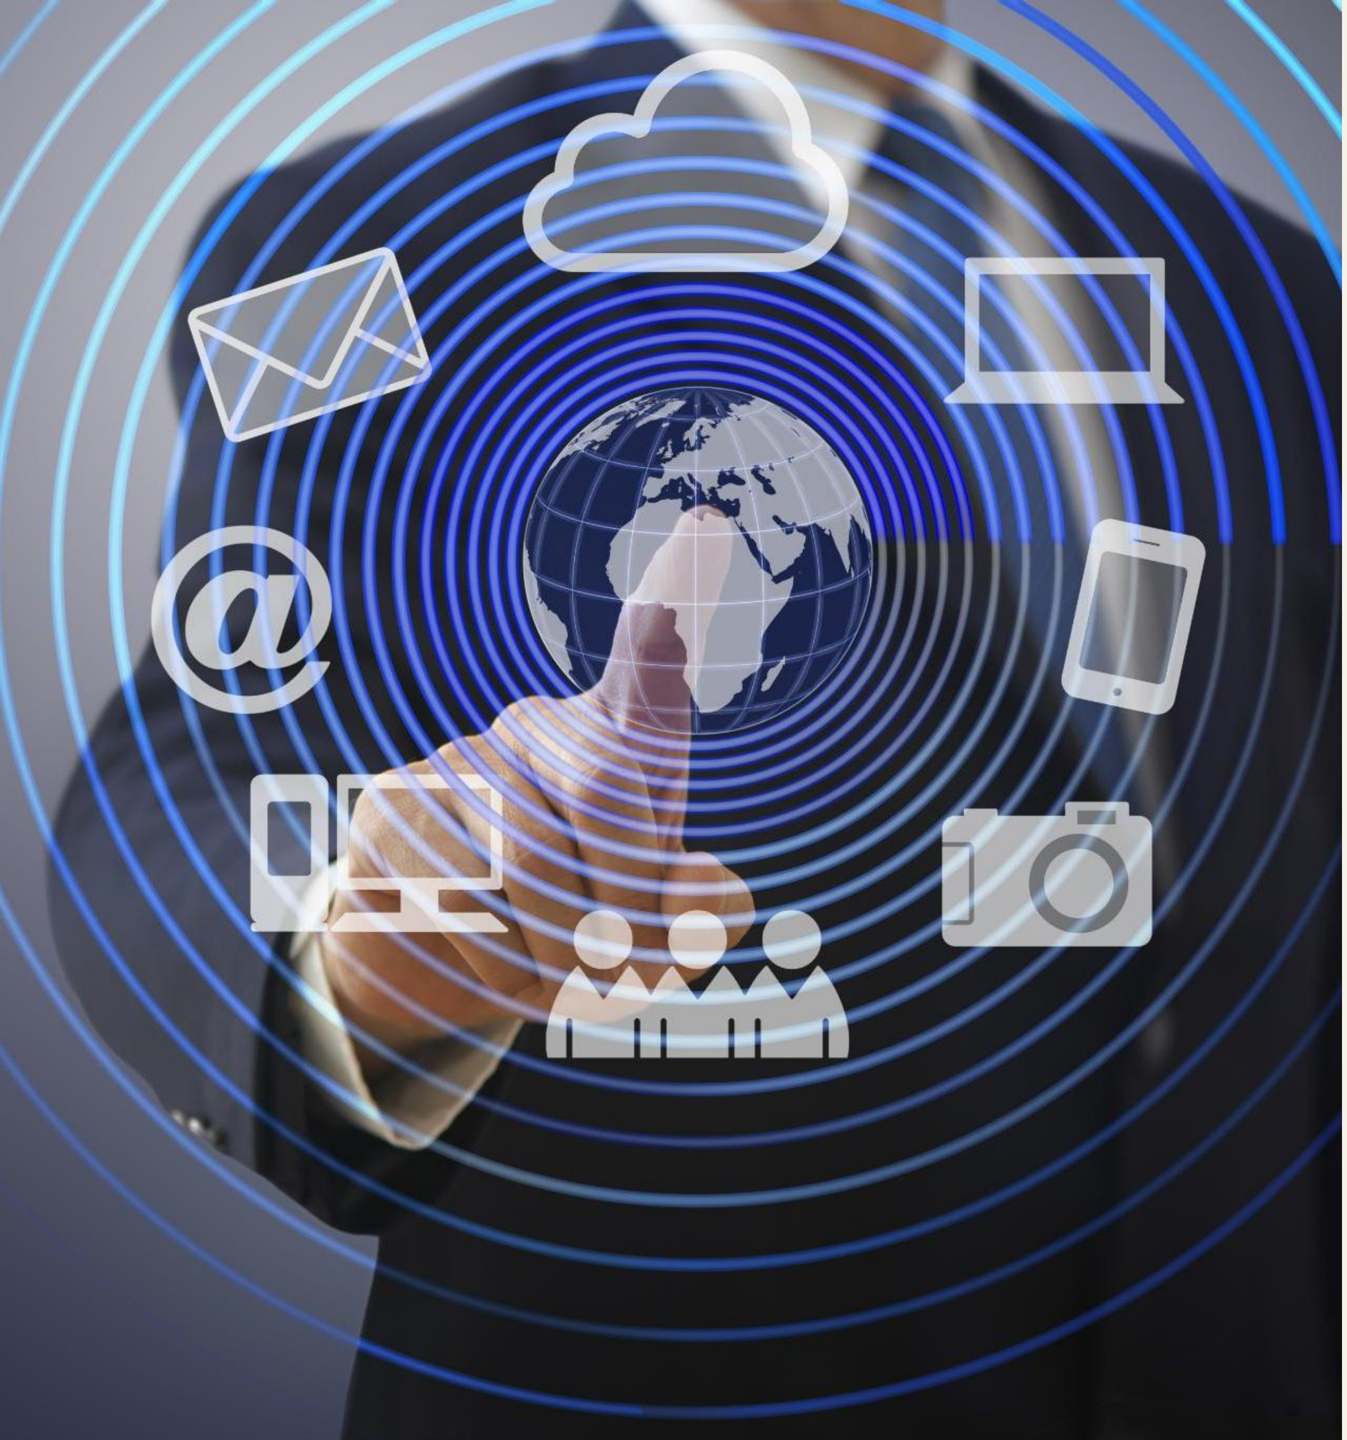
preview

- Dataverse tables (max 15).
- Natural language queries are transformed in analytical queries (e.g., SQL) over structured data

Graph Connectors

preview

- Connect to additional enterprise knowledge sources that are indexed in Microsoft Graph.
- Salesforce, ServiceNow, Confluence, Azure DevOps Wiki, etc.



OVERVIEW OF SUPPORTED KNOWLEDGE SOURCES

Internal Knowledge Sources

Copilot Studio integrates internal data such as Dataverse, SharePoint, OneDrive documents, and various uploaded file formats.

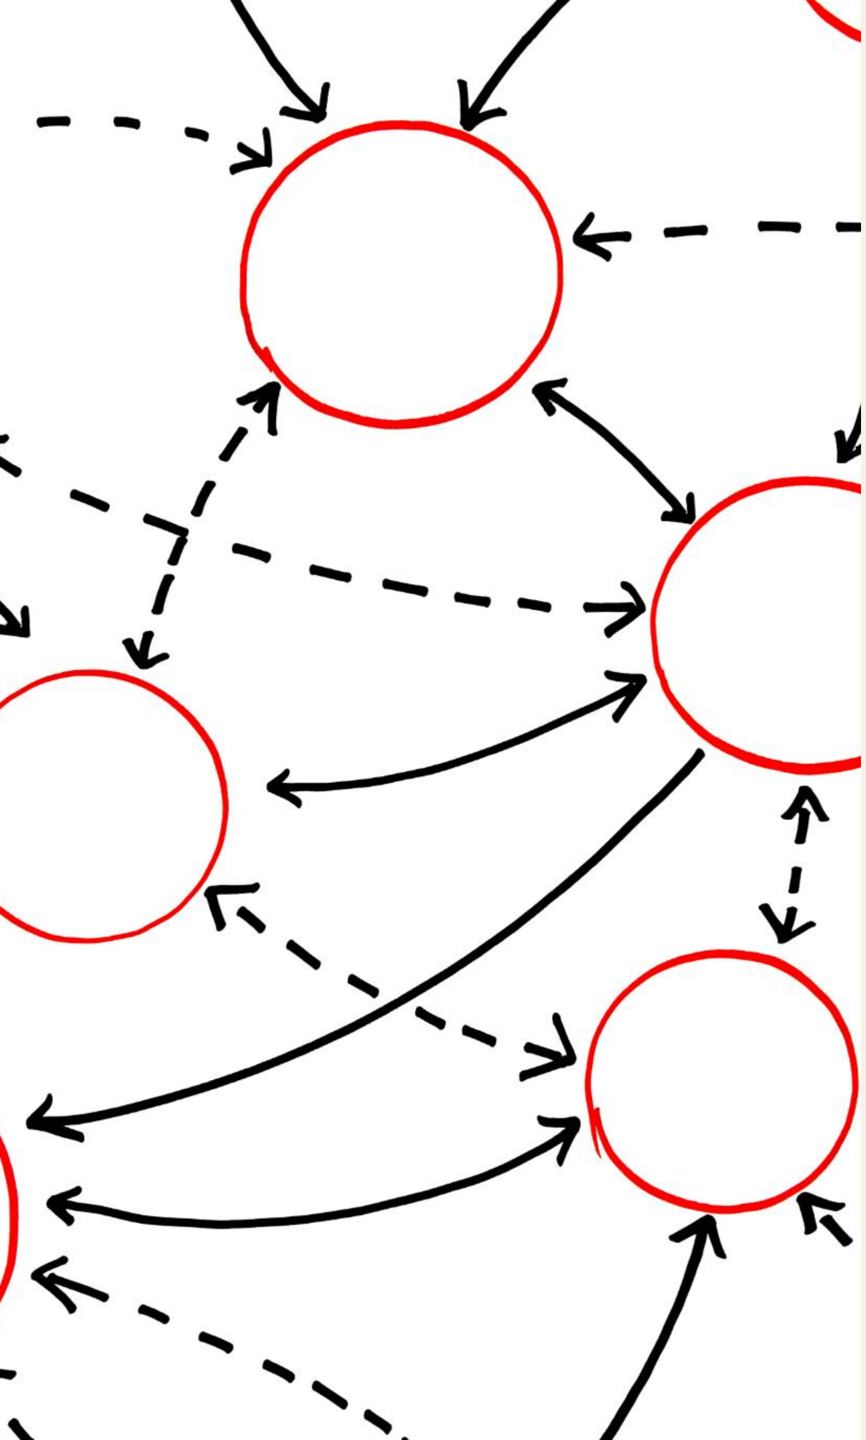
External Knowledge Sources

External data sources include public websites, Azure AI Search, and enterprise systems accessed through Power Platform connectors.

Configuration Interface

A graphical interface allows makers to configure and manage knowledge sources at both agent and topic levels.

VECTORIZATION AND SEMANTIC INDEXING



UNDERSTANDING THE VECTORIZATION PIPELINE

Document Chunking

Documents are split into smaller chunks to enable detailed and granular information retrieval.

Vector Embedding

Each chunk is embedded into a high-dimensional vector capturing semantic meaning using advanced embedding models.

Similarity Search

Queries are vectorized and matched against stored vectors to find the most relevant information chunks.

LLM Grounded Response

Retrieved chunks feed into a large language model to generate accurate, contextually aligned responses.

RETRIEVAL-AUGMENTED GENERATION (RAG)

RAG WORKFLOW AND DIAGRAM

Document Ingestion and Chunking

Documents are ingested and divided into smaller chunks for semantic processing and embedding.

Semantic Vector Embedding

Chunks are converted into dense semantic vectors and stored securely in a vector index.

Query Vectorization and Similarity Search

User queries are embedded and matched against stored vectors to find semantically relevant chunks.

Response Generation by LLM

The LLM synthesizes responses using the top-matched chunks, integrating external data with AI knowledge.

HOW VECTORIZATION WORKS

1. Chunking

When a document or data source is added:

It is **split into smaller chunks** (e.g., paragraphs or sections).

This improves retrieval granularity and performance.

2. Embedding

Each chunk is transformed into a **vector embedding**:

A vector is a high-dimensional numerical representation of the **semantic meaning** of the text.

Embeddings are generated using models like **OpenAI's text-embedding-ada-002** or similar models hosted in **Azure OpenAI**. [Integratin...Search ...]

3. Indexing

These vectors are stored in a **vector index**, either in **Dataverse** or **Azure AI Search**.

The index allows **fast similarity search** using cosine similarity or other distance metrics.

4. Query Vectorization

When a user sends a query, it is also **vectorized** using the same embedding model.

The system compares the query vector to the indexed vectors to find the **most semantically similar chunks**.

5. Retrieval and Generation

The top-matching chunks are retrieved.

The LLM (e.g., GPT) uses these chunks to **generate a grounded response**, citing the source when applicable.

DATA GOVERNANCE AND ACCESS CONTROL

Secure Data Storage

Vectorized data is securely stored in enterprise-grade compliant data platforms to protect sensitive information.

Role-Based Access Control

Access is managed through role-based controls, ensuring users see only authorized data maintaining confidentiality.

Automated Data Re-indexing

Automatic and scheduled re-indexing keeps data sources updated for accurate and fresh AI responses.

Real-time Data Retrieval

Real-time retrieval capabilities boost response freshness and relevance in AI interactions.

Copilot Studio

Your copilot, your way

Add tools to your agent

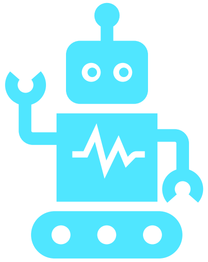
Demoer – Tools

Copilot Studio Tool Types Overview

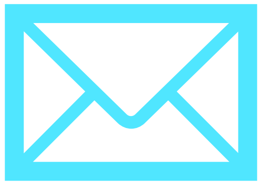
Technical Overview of Tools in Microsoft Copilot Studio

Prompt Tools

- Use natural language prompts to generate responses or perform tasks



- Powered by AI Builder and LLMs



- Examples: Summarize documents, generate email drafts, answer questions

Agent Flows

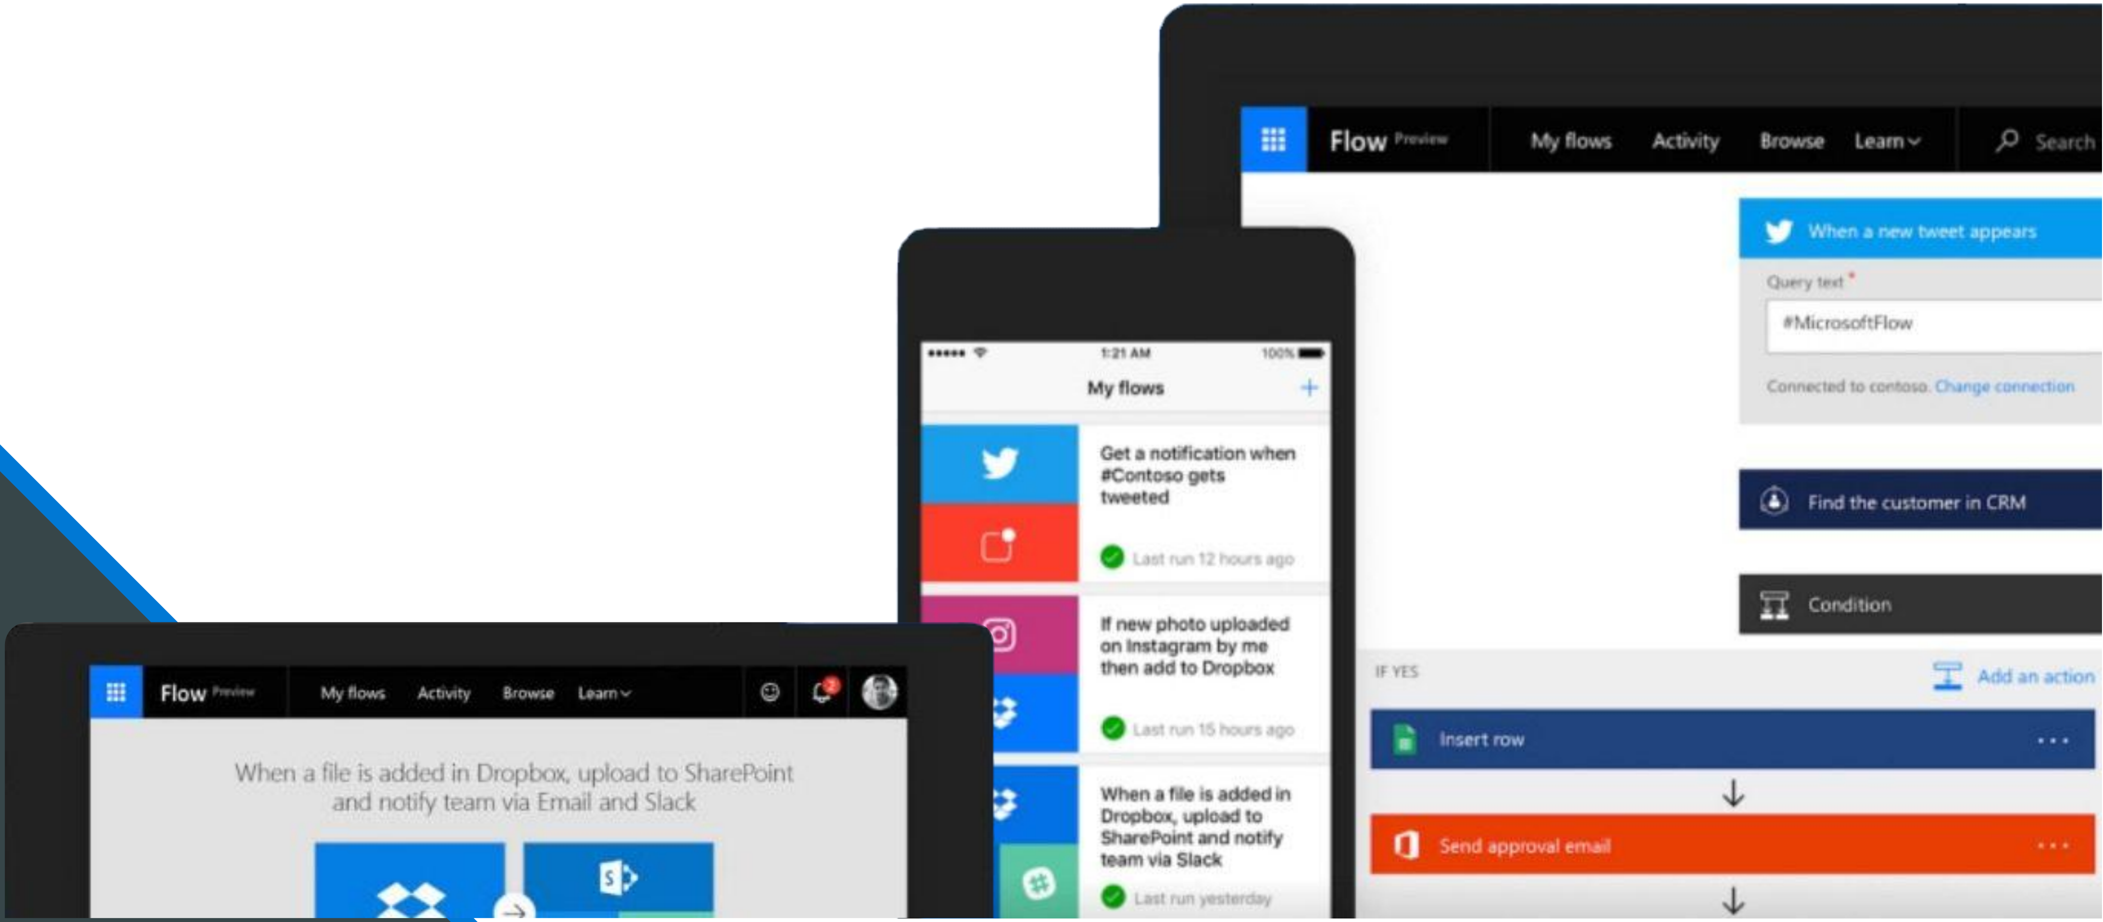
- Automate business processes using Power Automate

- Triggered by user input or agent logic

- Examples: Cancel an order, update CRM record, send notifications

Microsoft Power Automate

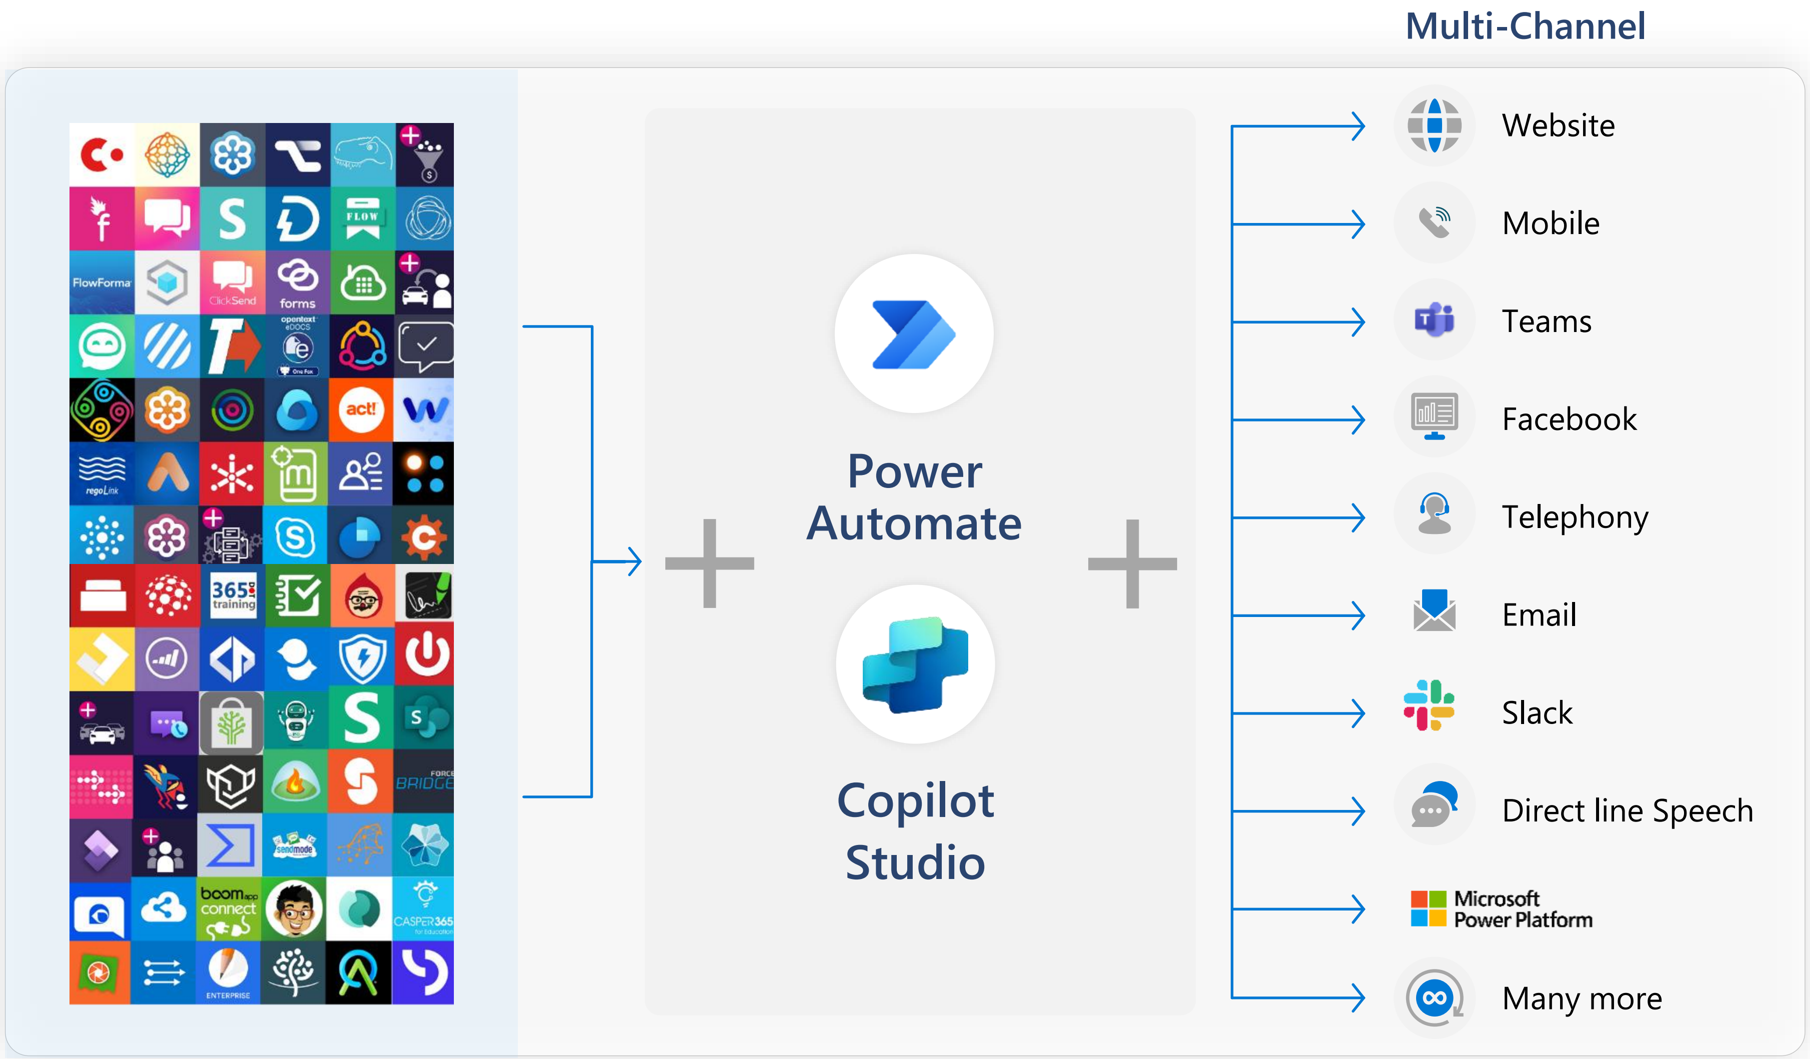
is an online workflow service that **automates actions** across apps and services



Power Platform Connectors

- Power Platform, including Power Automate and Copilot Studio, offers great integration capabilities, with more 1,200 native connectors or ways to create your own custom connectors to your APIs.

- For a good end-user experience, cloud flows, HTTP requests and connectors triggered from Copilot Studio must execute quickly so that the user doesn't have to wait too long for the copilot to answer.



1200+ prebuilt data connectors

A service for automating workflows across apps and services

CONNECT

to data & systems you're already using, and create the data you need

CREATE

workflows using triggers & actions without code or scripts

EDIT

flows on web and mobile

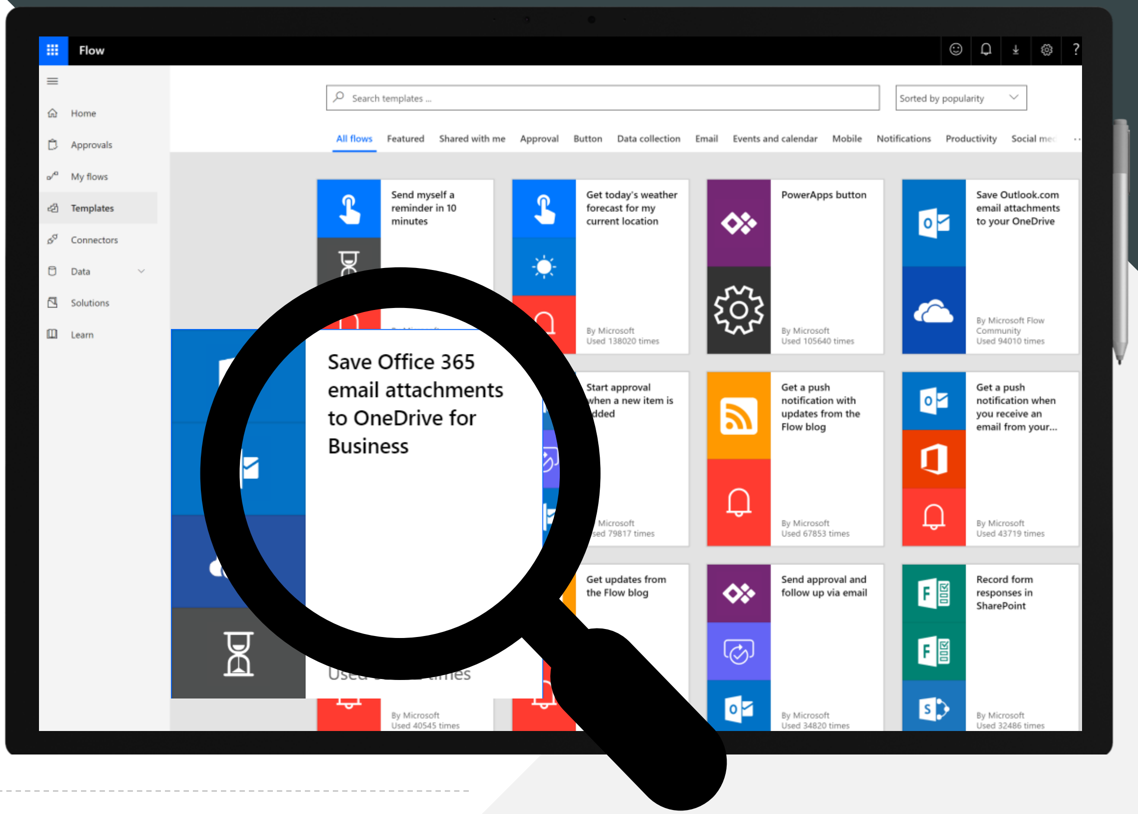
APPROVE

requests or manage them on web and mobile

Get started with a growing library of templates

Jumpstart flows using over 100+ templates for common scenarios

Connect services you're already using in more meaningful ways

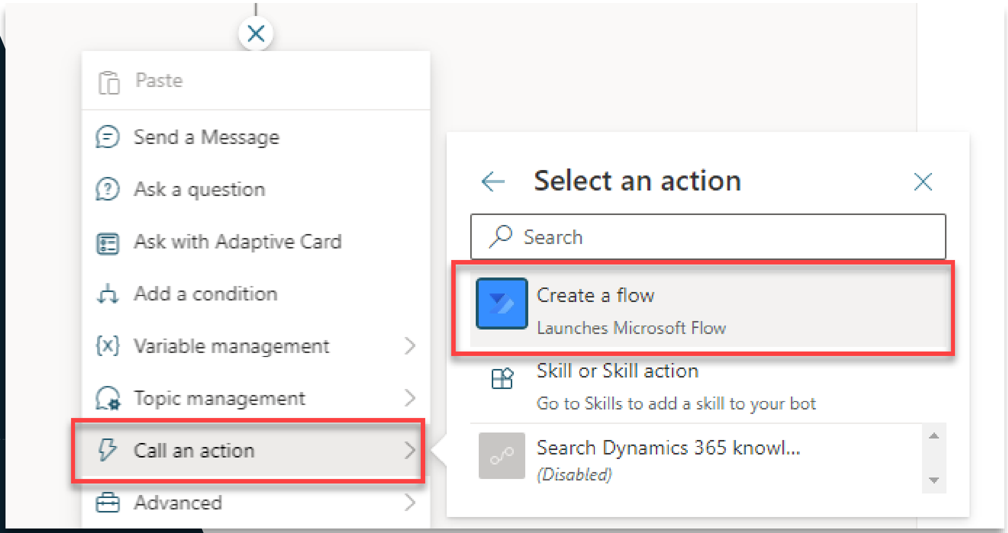


Unlock your imagination with Power Automate + Copilot Studio

- Copilot Studio uses location-based services (LBS) to provide personalized services
- 2-factor authentications to increase security
- Proactively recommends new promotions, benefits, and better rates to your customers
- Check user eligibility and submit applications on their behalf
- Remote diagnosis for IOT devices
- Make appointments for your customers
- Get a picture of the receipt from employee and use Azure AI for expense reimbursement (integration with Azure AI)

Create a Flow from Copilot Studio

- Directly within the Copilot Studio canvas, click ‘Create a flow’
- Power Automate opens and creates the input and output to pass data
- Add your own custom logic in between to configure it to meet your needs

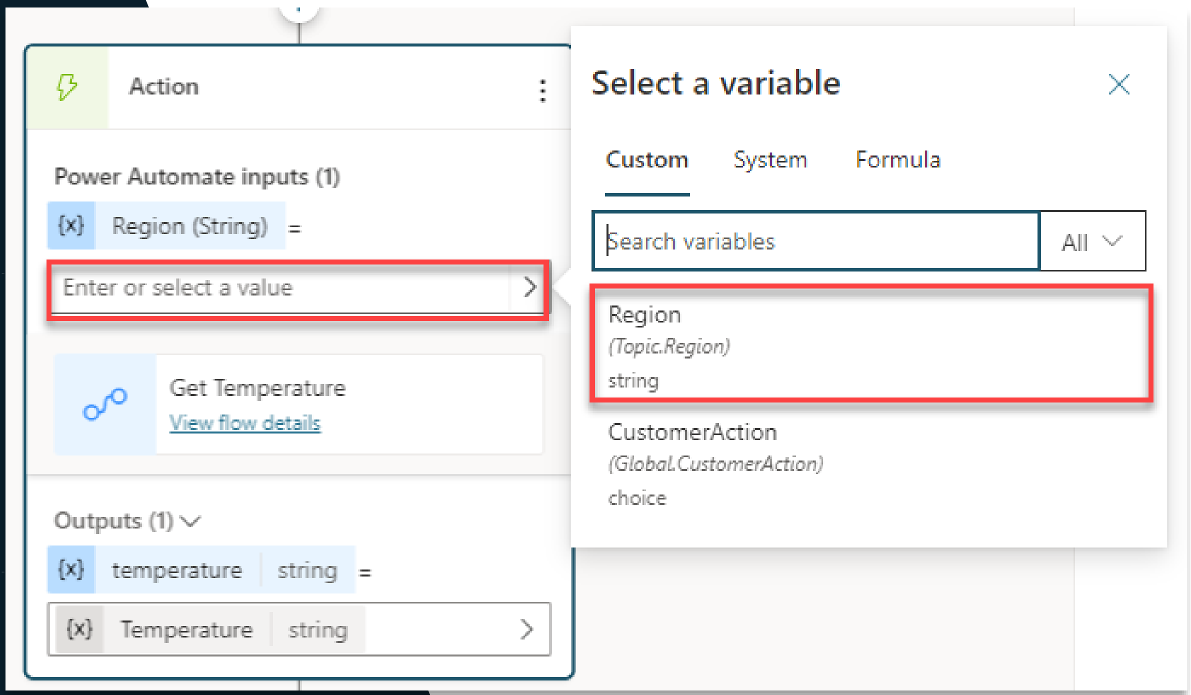


Manage the return of data in Copilot Studio from Power Automate

Specify which variables to send to Power Automate within Copilot Studio

Save data from Power Automate into Copilot Studio variables

Use those variables to perform conditional logic, calculations or display them to the user



Prebuilt Connectors

- CONNECT TO MICROSOFT AND THIRD-PARTY SERVICES

- EXAMPLES: OUTLOOK, SHAREPOINT, DYNAMICS 365

- USE CASES: SEND EMAILS, RETRIEVE CALENDAR EVENTS, ACCESS DATA

Custom Connectors

- Integrate with external systems via REST/SOAP APIs

- Use Power Platform to define connector logic

- Examples: Connect to proprietary HR systems or legacy databases

REST API Tools

- Directly consume external REST APIs

- Upload Swagger/OpenAPI definitions

- Examples: Fetch weather data, stock prices, analytics

Model Context Protocol (MCP)

- Connect to external knowledge servers or structured data sources

- Examples: Query enterprise knowledge graphs, semantic search

Computer Use (Preview)

- Automate GUI interactions like clicking and typing

- Examples: Fill out web forms, scrape data, simulate user actions

Use Cases for Tools in Copilot Studio

Exploring practical applications enhancing productivity and creativity

Unlocking Productivity with Copilot Studio Tools

AI-Driven Productivity

Copilot Studio integrates AI tools to streamline workflows and boost user productivity efficiently.

Core Platform Tools

Features like Prompt Builder, Custom Connectors, Plugins, and Generative AI enhance operational capabilities.

Benefits for Teams

Teams automate repetitive tasks and generate content quickly, improving efficiency and decision-making.

Core Tools in Copilot Studio

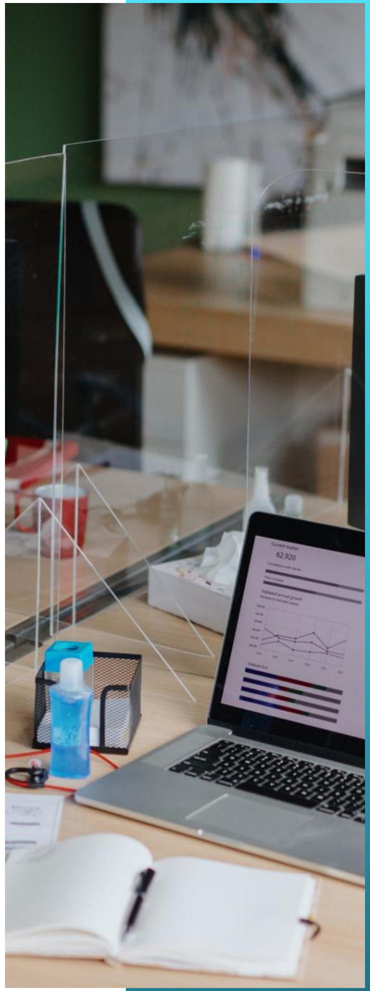
Key Tools in Copilot Studio

Prompt Builder
Enables creation of custom AI prompts for tailored interactions and automation.

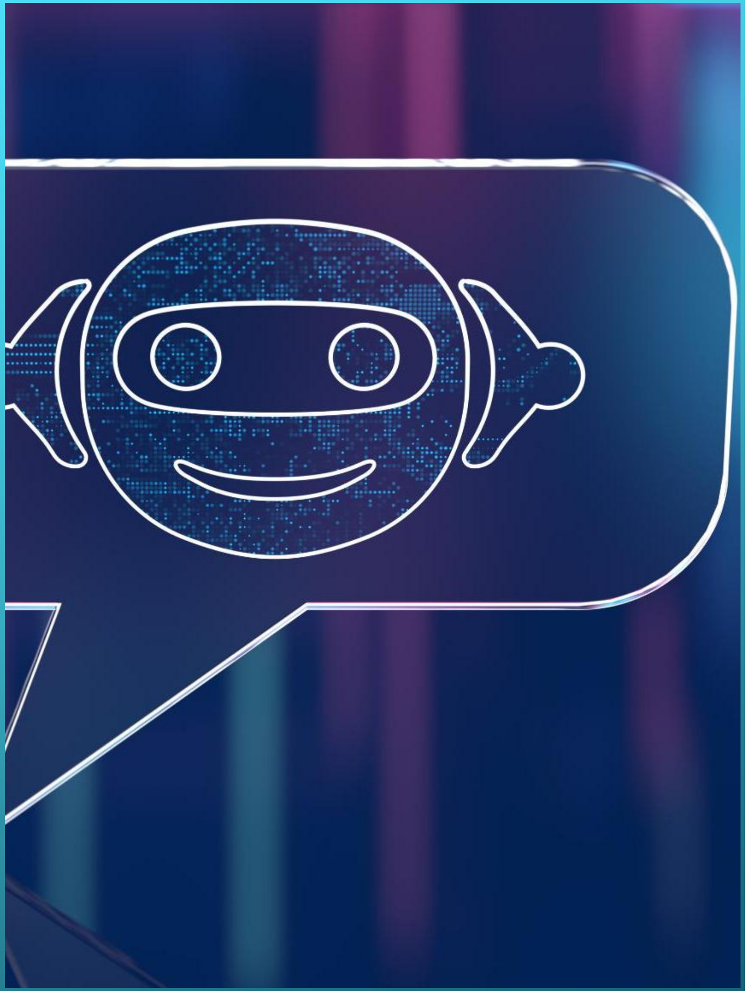
Custom Connectors
Facilitates integration with external data sources for seamless information analysis.

Plugins and Extensions
Extends platform functionality enabling specialized operations and improved workflows.

Generative AI Features
Supports content creation such as drafting emails and product descriptions efficiently.



Use Cases



Use Case 1 – Automating Customer Support

Intelligent Chatbots

Combining Prompt Builder and Generative AI enables chatbots to handle FAQs and escalate complex issues effectively.

Reduced Response Times

Automation can reduce customer response times by up to 60%, improving satisfaction and efficiency.

Operational Efficiency

Automation frees support staff to focus on critical tasks, boosting overall operational productivity.

Use Case 2 – Data-Driven Insights

Automated Data Retrieval
Custom Connectors pull data automatically from diverse sources like CRM systems, simplifying data access.

Natural Language Summaries
NLP is used to generate easy-to-understand trend summaries for quick decision-making.

AI-Driven Predictive Analytics
AI integration provides contextual insights and forecasts to enhance decision quality.

Enhanced Decision Efficiency
Automating analysis accelerates insights delivery, enabling faster and informed decisions.

Use Case 3 – Content Generation

Time-Saving Content Creation

Generative AI drafts marketing emails and social media posts, saving hours of manual effort.

Maintaining Brand Consistency

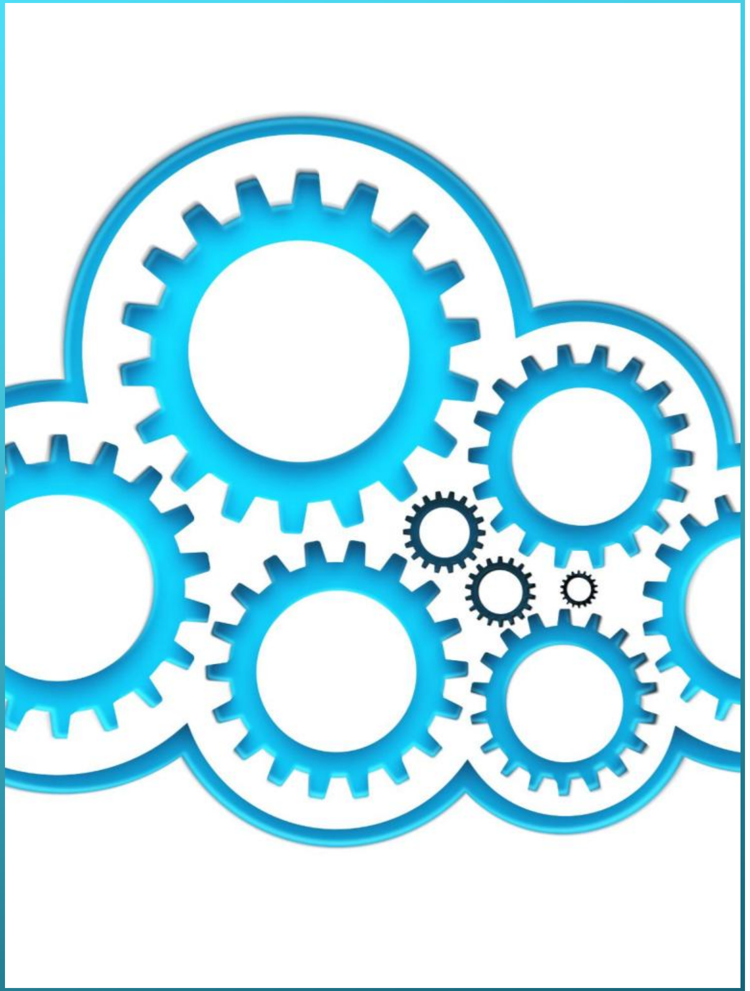
The AI maintains brand tone and style ensuring consistent communication across channels.

Scaling Marketing Output

Marketing teams can scale output efficiently, focusing on strategy and refinement.

Content Variation for Optimization

AI generates multiple content variations allowing A/B testing and campaign optimization.



Use Case 4 – Workflow Automation

Automating Repetitive Tasks

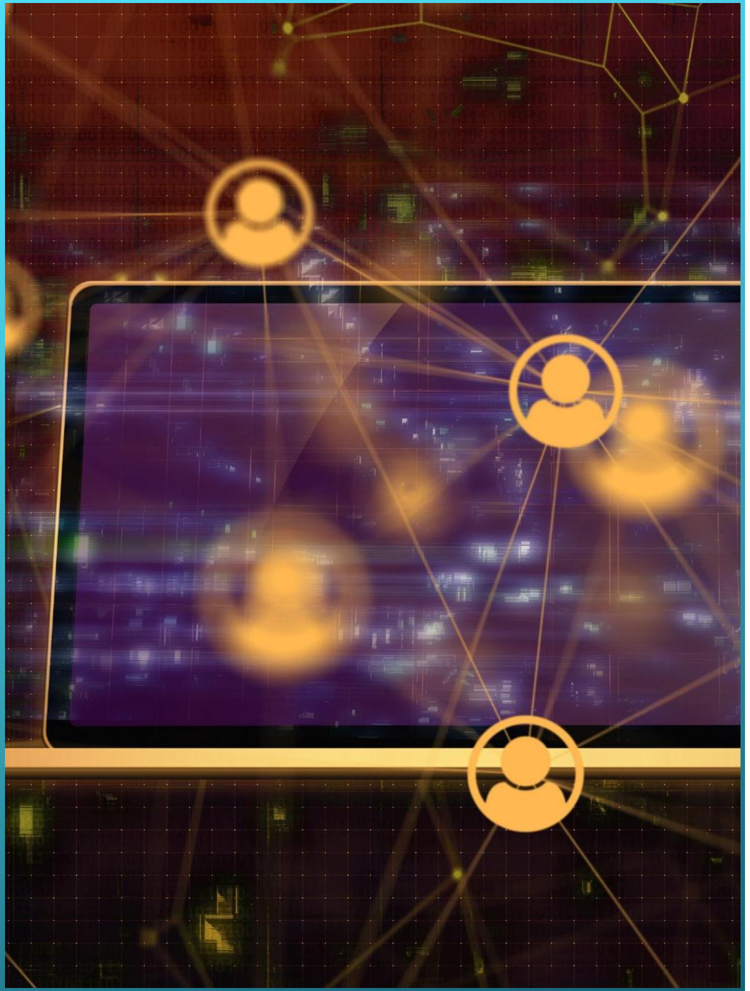
Workflow automation handles repetitive tasks like invoice processing and data entry, reducing manual errors effectively.

Customization for Business Needs

Automation can be tailored to specific business processes, ensuring operations are relevant and efficient.

Improved Productivity and Scalability

Streamlined operations lead to faster turnaround times and scalable integration with existing systems.



Use Case 5 – Personalized Experiences

AI-driven Personalization

AI models analyze customer data to create tailored recommendations, messages, and interactions improving engagement.

Real-time Adaptation

The AI system adapts dynamically in real-time based on user behavior to maintain relevant experiences.

Impact on Business Sectors

Personalization enhances customer loyalty and satisfaction in e-commerce, marketing, and customer service.
